**The Blue-Green Algae** G Fogg, 2012-12-02 The Blue Green Algae attempts to assemble a unified picture of blue green algae as living organisms It describes the organism s general features of form and structure cellular organization cell biology gas vacuoles and movements The book addresses the culture nutrition growth photosynthesis chemosynthesis heterotrophy respiration nitrogen metabolism differentiation reproduction and life cycles of the blue green algae The organisms freshwater and terrestrial ecology pathogens symbiosis evolution and phylogeny are also explained These organisms form a substantial fraction of the biomass in several important types of habitat Consequently it is desirable to understand their activities if natural resources are to be conserved and used to best advantage This book will be useful to students and research workers in this field of interest

The

Ecological Bases for Lake and Reservoir Management David M. Harper, 1999-09-30 The Ecological Bases for Lake and

Reservoir Management provides a state of the art review of the range of ecologically based techniques necessary for the holistic management of lakes and their catchments Most of the methods case studies and national policies reviewed are directed towards management of the largest problem eutrophication with the emphasis on the multiple scale approach needed for successful management and restoration Case studies come from the USA and ten European countries and range from single lakes through to lake districts and national inventories Several essays precede the practical chapters with thought provoking comments on the political social and economic climate of water management

Otto Latva, Heta Lähdesmäki, Kirsi Sonck-Rautio, Harri Uusitalo, 2024-09-23 This book explores the human relationship to changing biodiversity by bringing together multidisciplinary insights into human nature relations from the humanities New animal and plant species arrive and previously existing ones may disappear However the historical and social perspectives of the changes have been understudied so far This book approaches the human relationship with changing biodiversity from three different angles belonging and non belonging emotions and environmental policy The question of belonging and non belonging is crucial when it comes to changing biodiversity The authors ask who decides where species can move and live and when invasive becomes native Similarly emotions have a big role in human nature relations The book shows why we

grieve the loss of some species and hate some other species and how our emotions change over time The writers also aim to show how environmental policies or the practice of governing species are affected by societal discussion emotions scientific research and topical concepts as well as how these policies shape biodiversity and our perceptions of different species The authors provide fresh insights into human nature relations and explain why we need multidisciplinary approaches in order to fully understand their complexity

Outside Russia very little is known about the terrestrial ecology vegetation biogeographical patterns and biodiversity of the enormously extensive ecosystems of Yakutia Siberia These systems are very special in that they function on top of huge layers of permafrost and are exposed to very severe and extreme weather conditions the range between winter and summer temperatures being more than 100 degrees C The soils are generally poor and human use of the vegetation is usually extensive Main vegetation zones are taiga and tundra but Yakutia also supports a special land and vegetation form caused by permafrost the alas more or less extensive grasslands around roundish lakes in taiga All these vegetation types will be described and their ecology and ecophysiological characteristics will be dealt with Because of the size of Yakutia covering several climatic zones and its extreme position on ecological gradients Yakutia contains very interesting biogeographical patterns which also will be described Our analyses are drawn from many years of research in Yakutia and from a vast body of ecological and other literature in Russian publications and in unpublished local reports The anthropogenic influence on the ecosystems will be dealt with This includes the main activities of human interference with nature forestry extensive reindeer herding cattle and horse grazing etc Also fire and other prominent ecological factors are dealt with A very important point is also the very high degree of naturalness that is still extant in Yakutia's main vegetation zones

*Biology of the Prokaryotes* Joseph W. Lengeler, Gerhart Drews, Hans G. Schlegel, 1999-02-03 Designed as an upper level textbook and a reference for researchers this important book concentrates on central concepts of the bacterial lifestyle Taking a refreshingly new approach it presents an integrated view of the prokaryotic cell as an organism and as a member of an interacting population Beginning with a description of cellular structures the text proceeds through metabolic pathways and metabolic reactions to the genes and regulatory mechanisms At a higher level of complexity a discussion of cell differentiation processes is followed by a description of the diversity of

prokaryotes and their role in the biosphere A closing section deals with man and microbes ie applied microbiology The first text to adopt an integrated view of the prokaryotic cell as an organism and as a member of a population Vividly illustrates the diversity of the prokaryotic world nearly all the metabolic diversity in living organisms is found in microbes New developments in applied microbiology highlighted Extensive linking between related topics allows easy navigation through the book Essential definitions and conclusions highlighted Supplementary information in boxes

*Pond Aquaculture Water Quality Management* Claude E. Boyd,C.S. Tucker,2012-12-06 The efficient and profitable production of fish crustaceans and other aquatic organisms in aquaculture depends on a suitable environment in which they can reproduce and grow Because those organisms live in water the major environmental concern within the culture system is water quality Water supplies for aquaculture systems may naturally be of low quality or polluted by human activity but in most instances the primary reason for water quality impairment is the culture activity itself Manures fertilizers and feeds applied to ponds to enhance production only can be partially converted to animal biomass Thus at moderate and high production levels the inputs of nutrients and organic matter to culture units may exceed the assimilative capacity of the ecosystems The result is deteriorating water quality which stresses the culture species and stress leads to poor growth greater incidence of disease increased mortality and low production Effluents from aquaculture systems can cause pollution of receiving waters and pollution entering ponds in source water or chemicals added to ponds for management purposes can contaminate aquacultural products Thus water quality in aquaculture extends into the arenas of environmental protection and food quality and safety A considerable body of literature on water quality management in aquaculture has been accumulated over the past 50 years The first attempt to compile this information was a small book entitled *Water Quality in Warmwater Fish Ponds* Boyd I 1979a
