Ice in the Climate System W. Richard Peltier,2013-06-29 According to my latest model for the last glacial maximum LGM Grosswald 1988 the Arctic continental margin of Eurasia was glaciated by the Eurasian ice sheet which consisted of three interconnected ice domes the Scandinavian Kara and East Siberian The Kara Sea glacier was largely a marine ice dome grounded on the sea s continental shelf The ice dome discharged its ice in all directions northward into the deep Arctic Basin southward and westward onto the mainland of west central North Siberia the northern Russian Plain and over the Barents shelf into the Norwegian Greenland Sea On the Barents shelf the Kara ice dome merged with the Scandinavian ice dome In the Arctic Basin the discharged ice floated and eventually coalesced with the floating glacier ice of the North American provenance giving rise to the Central Arctic ice shelf Along its southern margin the Kara ice dome impounded the northward flowing rivers causing the formation of large proglacial lakes and their integration into a transcontinental meltwater drainage system Despite the constant increase in corroborating evidence the concept of a Kara ice dome is still considered debatable and the ice dome itself problematic As a result a paleogeographic uncertainty takes place which is aggravated by the fact that a great deal of existing knowledge no matter how broadly accepted is based on ambiguous interpretations of the data most of which are published in Russian and therefore not easily available to western scientists

Cratering in Marine

Environments and on Ice Henning Dypvik,Mark J. Burchell,Philippe Claeys,2013-06-29 Despite their global importance little is known about the few existing examples of impacts into marine environments and icy targets They are among the least understood and studied parts of impact crater geology The icy impacts are also of great importance in understanding the developments of the outer planets and their satellites such as Mars or Europa Furthermore the impact mechanisms crater formation and collapse melt production and the ejecta distribution are scarcely known for impact on targets other than the classical solid silicates of the continental crust The reaction of water and ice to impacts clearly deserves a more thorough study The understanding of impact effects and consequences in the case of aqueous hits soft sediments and icy targets has not been thoroughly explored and comprises the main focus of this book A number of papers in the field of hypervelocity impacts on ice are included These cover a review of available literature in the field of laboratory studies of such impacts large impact structures on Titan predicting impact cratering on a comet nucleus and a novel report on the survival of bacteria fired at hypervelocity into icy surfaces This latter paper is concerned with astrobiology and in particular Panspermia natural migration of life through space
