**Models of Seizures and Epilepsy** Asla Pitkänen, Philip A. Schwartzkroin, Solomon L. Moshé, 2005-10-04. An understanding of mechanisms underlying seizure disorders depends critically on the insights provided by model systems. In particular, with the development of cellular, molecular, and genetic investigative tools, there has been an explosion of basic epilepsy research. Models of Seizures and Epilepsy brings together for the first time in 30 years an overview of the most widely used models of seizures and epilepsy. Chapters cover a broad range of experimental approaches from in vitro to whole animal preparations, a variety of epileptiform phenomenology including burst discharges and seizures, and suggestions for model characterization and validation such as electrographic, morphologic, pharmacologic, and behavioral features. Experts in the field provide not only technical reviews of these models but also conceptual critiques commenting on the strengths and limitations of these models, their relationship to clinical phenomenology, and their value in developing a better understanding and treatments. Models of Seizures and Epilepsy is a valuable practical reference for investigators who are searching for the most appropriate laboratory models for addressing key questions in the field. It also provides an important background for physicians, fellows, and students, offering insight into the potential for advances in epilepsy research. The first comprehensive description of animal models of epilepsy since the early 1970s. Comprehensive analysis of what the models model to guide the selection of each model and what specific questions it will answer. Elegant examples of the use of novel technologies that can be applied in experimental epilepsy research. World expert opinions on the clinical relevance of each model.

patients Chronic pain is one of the most important health problems worldwide It has been estimated that 10% of adults are diagnosed with chronic pain each year However despite the high prevalence of chronic pain its management is still no fully satisfactory probably due to the variety of chronic pain conditions with different etiologies neuropathic visceral and musculoskeletal pain and because their pathophysiological mechanisms are only partially known Therefore there is a huge need for new effective therapies for the control and or prevention of the different types of chronic pain Chronic pain is associated with plastic changes in pain circuits of the peripheral and central nervous system including changes in the expression of ion channels neurotransmitters and receptors In addition there is growing consensus on non neuronal mechanisms that can amplify or resolve chronic pain and cells traditionally thought to act just as coordinators of the inflammatory response such as immune and glial cells are now accepted as real modulators of pain signaling In this regard animal models of persistent pain such as models of neuropathic and visceral pain and models of arthritis are helping to elucidate our understanding of the pathogenesis of chronic pain and make it possible to test experimental treatments
