**Model Emergent Dynamics in Complex Systems** A. J. Roberts, 2014-12-18 Arising out of the growing interest in and applications of modern dynamical systems theory this book explores how to derive relatively simple dynamical equations that model complex physical interactions The author's objectives are to use sound theory to explore algebraic techniques develop interesting applications and discover general modeling principles Model Emergent Dynamics in Complex Systems unifies into one powerful and coherent approach the many varied extant methods for mathematical model reduction and approximation Using mathematical models at various levels of resolution and complexity the book establishes the relationships between such multiscale models and clarifying difficulties and apparent paradoxes and addresses model reduction for systems resolves initial conditions and illuminates control and uncertainty The basis for the author's methodology is the theory and the geometric picture of both coordinate transforms and invariant manifolds in dynamical systems in particular center and slow manifolds are heavily used The wonderful aspect of this approach is the range of geometric interpretations of the modeling process that it produces simple geometric pictures inspire sound methods of analysis and construction Further pictures drawn of state spaces also provide a route to better assess a model's limitations and strengths Geometry and algebra form a powerful partnership and coordinate transforms and manifolds provide a powerfully enhanced and unified view of a swathe of other complex system modeling methodologies such as averaging homogenization multiple scales singular perturbations two timing and WKB theory

**Introduction to Complex Systems** Paul Fieguth,2021-09-03 Complex Systems lie at the heart of a variety of large scale phenomena of great significance global warming ice ages water poverty pandemics and this text uses these case studies as motivations and contexts to explore complex systems and related topics of nonlinear dynamics and power law statistics Although detailed mathematical descriptions of these topics can be challenging the consequences of a system being nonlinear power law or complex are in fact quite accessible This book blends a tutorial approach to the mathematical aspects of complex systems together with a complementary narrative on the global ecological societal implications of such systems Nearly all engineering undergraduate courses focus on mathematics and systems which are small scale linear and Gaussian Unfortunately there is not a single large scale ecological or social phenomenon that is scalar linear and Gaussian This book offers insights to better understand the large scale problems facing the world and to realize that these cannot be solved by a single narrow academic field or perspective Instead the book seeks to emphasize understanding concepts and ideas in a way that is mathematically rigorous so that the concepts do not feel vague but not so technical that the mathematics get in the way The book is intended for students in technical domains such as engineering computer science physics mathematics and environmental studies This second edition adds nine new examples over 30 additional problems 50 additional figures and three new chapters offering a detailed study of system decoupling extensive solutions to chapter problems and a timely discussion on the complex systems challenges associated with COVID 19 and pandemics in general      **A Complex Systems**

**Approach to Epilepsy** Rod C. Scott,J. Matthew Mahoney,2023-01-26 The epilepsies are devastating neurological disorders for which progress developing effective new therapies has slowed over recent decades primarily due to the complexity of the brain at all scales This reality has shifted the focus of experimental and clinical practice toward complex systems approaches to overcoming current barriers Organized by scale from genes to whole brain the chapters of this book survey the theoretical underpinnings and use of network and dynamical systems approaches to interpreting and modeling experimental and clinical data in epilepsy The emphasis throughout is on the value of the non trivial and often counterintuitive properties of complex systems and how to leverage these properties to elaborate mechanisms of epilepsy and develop new therapies In this essential book readers will learn key concepts of complex systems theory applied across multiple scales and how each of these scales connects to epilepsy      *Stochastic Pdes And Modelling Of Multiscale Complex System* Xiaopeng Chen,Yan

*Computer Simulation Studies in Condensed-Matter Physics XI* David P. Landau, Heinz-Bernd Schüttler, 2012-12-06 More than a decade ago because of the phenomenal growth in the power of computer simulations The University of Georgia formed the first institutional unit devoted to the use of simulations in research and teaching The Center for Simulational Physics As the simulations community expanded further we sensed a need for a meeting place for both experienced simulators and neophytes to discuss new techniques and recent results in an environment which promoted extended discussion As a consequence the Center for Simulational Physics established an annual workshop on Recent Developments in Computer Simulation Studies in Condensed Matter Physics This year's workshop was the eleventh in this series and the interest shown by the scientific community demonstrates quite clearly the useful purpose which the series has served The latest workshop was held at The University of

College London Mathematical and computer models for a complexity science tool kit Geographical systems are characterised by locations activities at locations interactions between them and the infrastructures that carry these activities and flows They can be described at a great variety of scales from individuals and organisations to countries Our understanding often partial of these entities and in many cases this understanding is represented in theories and associated mathematical models In this book the main examples are models that represent elements of the global system covering such topics as trade migration security and development aid together with examples at finer scales This provides an effective toolkit that can not only be applied to global systems but more widely in the modelling of complex systems All complex systems involve nonlinearities involving path dependence and the possibility of phase changes and this makes the mathematical aspects particularly interesting It is through these mechanisms that new structures can be seen to emerge and hence the current notion of emergent behaviour The range of models demonstrated include account based models and biproportional fitting structural dynamics space time statistical analysis real time response models Lotka Volterra models representing war agent based models epidemiology and reaction diffusion approaches game theory network models and finally integrated models Geo mathematical modelling Presents mathematical models with spatial dimensions Provides representations of path dependence and phase changes Illustrates complexity science using models of trade migration security and development aid Demonstrates how generic models from the complexity science tool kit can each be applied in a variety of situations This book is for practitioners and researchers in applied mathematics geography economics and interdisciplinary fields such as regional science and complexity science It can also be used as the basis of a modelling course for postgraduate students
