The allowable stress design ASD method has long been used for the design of steel structures in the United States. Recently the probability based load and resistance factor design LRFD criteria have been successfully applied to the structural design of hot rolled steel shapes and built up members. The AISI LRFD Specification is being developed as well for the design of structural members cold formed from carbon and low alloy steels. This design method is based on the Limit States Design philosophy which is related to the ultimate strength and serviceability of the structural members and connections. Cold formed stainless steel sections have gained increasing use in architectural and structural applications in recent years due to their superior corrosion resistance, ease of maintenance and attractive appearance. The current Specification for the design of cold formed stainless steel structural members and connections was published by American Iron and Steel Institute AISI in 1974. This design Specification was based on the allowable stress design method. In order to develop the new design criteria for cold formed stainless steel structural members, a research project entitled Load and Resistance Factor Design of Cold Formed Stainless Steel has been conducted at the University of Missouri Rolla. This project contains two phases: 1 to prepare an updated allowable stress design specification and 2 to develop the new load and resistance factor design criteria for cold formed stainless steel structural members and connections. The proposed new ASD Specification and Commentary for the design of cold formed stainless steel structural members have been completed and published in the Third Progress Report of this project. This dissertation mainly discusses the development of the LRFD criteria for cold formed stainless steel structural members and connections. These design criteria were developed on the basis of the first order probabilistic theory for which only the mean value and coefficient of variation of variables are required. These variables reflect the uncertainties in mechanical properties of materials, load effects, design assumption and fabrication. As the initial step of the investigation, statistical analyses of mechanical properties and thicknesses for various types of stainless steels have been evaluated. The modified Ramberg-Osgood equation has been used in this study for determining the secant modulus, tangent modulus and plasticity reduction factor. Theoretical basis of the probability based LRFD criteria and procedures used to calibrate the design provisions are discussed in detail. The resistance factors obtained from the calibrations have been recommended for use in the LRFD criteria. Because the LRFD method involves probabilistic considerations for uncertain variables in the design formulas, this method can provide a more uniform overall safety and reliability for structural design.

Burgan, 1995 **Thin-Walled Structures** J.Y. Richard Liew, V. Thevendran, N.E. Shanmugam, 1998-11-27 Thin plated structures are used extensively in building construction automobile aircraft shipbuilding and other industries because of a number of favourable factors such as high strength weight ratio development of new materials and processes and the availability of efficient analytical methods This class of structure is made by joining thin plates together at their edges and they rely for their rigidity and strength upon the tremendous stiffness and load carrying capacity of the flat plates from which they are made Many of the problems encountered in these structures arise because of the effects of local buckling The

knowledge of various facets of this phenomenon has increased dramatically since the 1960s Problem areas which were hitherto either too complex for rigorous analysis or whose subtleties were not fully realized have in these years been subjected to intensive study Great advances have been made in the areas of inelastic buckling The growth in use of lightweight strong materials such as fibre reinforced plastics has also been a contributory factor towards the need for advances in the knowledge of the far post buckling range The conference is a sequel to the international conference organised by the University of Strathclyde in December 1996 and this international gathering will provide the opportunity for discussion of recent developments and trends in design of thin walled structures *Constructional Steel Design* P.J.

Kowal-Michalska, J. Rhodes, 2001-06-18 This volume contains the papers presented at the Third International Conference on Thin Walled Structures Cracow Poland on June 5 7 2001 There has been a substantial growth in knowledge in the field of Thin Walled Structures over the past few decades Lightweight structures are in widespread use in the Civil Engineering Mechanical Engineering Aeronautical Automobile Chemical and Offshore Engineering fields The development of new processes new methods of connections new materials has gone hand in hand with the evolution of advanced analytical methods suitable for dealing with the increasing complexity of the design work involved in ensuring safety and confidence in the finished products Of particular importance with regard to the analytical process is the growth in use of the finite element

method This method about 40 years ago was confined to rather specialist use mainly in the aeronautical field because of its requirements for substantial calculation capacity The development over recent years of extremely powerful microcomputers has ensured that the application of the finite element method is now possible for problems in all fields of engineering and a variety of finite element packages have been developed to enhance the ease of use and the availability of the method in the engineering design process
