Software Engineering For Largescale Multitagent Systems Research Ibues And Practical Applications:

Software Engineering for Large-Scale Multi-Agent Systems Alessandro Garcia, Carlos Lucena, Franco Zambonelli, Andrea Omicini, Jaelson Castro, 2003-08-03 Nowadays engineering large scale software systems means dealing with complex systems composed of pervasive software components that move around and adapt to nondeterministic and open environments like the Internet in order to achieve systems design goals through the coordination of autonomously distributed services The agent metaphor in particular software agents and multi agent systems MAS constitutes a promising approach for covering most of the software development life cycle from conceptual modeling and requirements specification to architectural definition design and implementation This book presents 17 carefully reviewed papers arranged in order to provide a coherent survey of how to exploit agent properties and MAS issues in today s software systems The book offers the following topical sections software engineering foundations requirements engineering and software architecture coordination and mobility reuse dependability empirical studies and applications

Software Engineering for Multi-Agent Systems IV Alessandro Garcia, Ricardo Choren, Carlos Lucena, Paolo Giorgini, Tom Holvoet, Alexander Romanovsky, 2006-04-27 This book presents a coherent well balanced survey of recent advances in software engineering approaches to the design and analysis of realistic large scale multi agent systems MAS The chapters included are devoted to various techniques and methods used to cope with the complexity of real world MAS Reflecting the importance of agent properties in today s software systems the power of agent based software engineering is illustrated using examples that are representative of successful applications

Software Engineering for Multi-Agent Systems II Carlos Lucena, Alessandro Garcia, Alexander Romanovsky, Jaelson Castro, Paulo S.C. Alencar, 2004-02-24 Advances in networking technology have revitalized the investigation of agent technology as a promising paradigm for engineering complex distributed software systems Agent technology has been applied to a wide range of application mains including e commerce human computer interfaces telecommunications and software assistants Multi agent systems MASs and their underlying theories provide a more natural support for ensuring important properties such as autonomy mobility environment heterogeneity organization openness and intelligence As a consequence agent based systems are likely to provide new proaches to dealing with the complexity of developing and maintaining modern software However developing robust large scale agent based systems will quire new software engineering approaches There are currently many methods and techniques for working with individual agents or with

systems built using only a few agents Unfortunately agent based software engineering is still in its infancy and existing software engineering approaches are unable to cope with large MASs The complexity associated with a large MAS is considerable When a huge number of agents interact over heterogeneous environments various phenomena occur which are not as easy to capture as when only a few agents are working together As the multiple software agents are highly collaborative and operate in networked environments they have to be context aware and deal with environment uncertainty This makes their coordination and management more difficult and increases the likelihood of exceptional situations such as security holes privacy violations and unexpected global effects Moreover as users and

software engineers delegate more autonomy to their MASs and put more trust in their results new concerns arise in real life applications

Brueckner, Yves Demazeau, 2008-07-31 Software intensive systems are increasingly expected to deal with changing user needs and dynamic operating conditions at run time. Examples are the need for life reconstructions, management of resource variability and dealing with particular failure modes. Endowing systems with these kinds of capabilities poses severe challenges to software engineers and necessitates the development of new techniques, practices and tools that build upon sound engineering principles. The field of multi agent systems focuses on the foundations and engineering of systems that consists of a network of autonomous entities, agents that interact to achieve the system goals. One line of research in multi agent systems inspired by biological, physical and other naturally occurring systems concerns multi agent systems in which agents share information and coordinate their behavior through a shared medium called an agent environment. Typical examples are gradient fields and digital pheromones that guide agents in their local context and as such facilitate the coordination of a community of agents. Since environment mediation in multi agent systems has shown to result in manageable solutions with very adaptable qualities, it is a promising paradigm to deal with the increasing complexity and dynamism of distributed applications. Control in environment mediated multi agent systems is decentralized, i.e. none of the components has full access or control over the system. Self organization is an approach to engineer decentralized distributed and resource limited systems that are capable of dynamically adapting to changing conditions and requirements without external intervention. This useful system property is often reflected in functions such as self configuration, self optimization and self healing. Engineering approaches to self organizing systems often rely on global functionality to emerge from local and autonomous decisions of individual agents that communicate through a shared agent environment.

Multi-Agent Systems and Applications IV Michal Pechoucek, Paolo Petta, Laszlo Zolt Varga, 2005-09-06 The aim of the CEEMAS conference series is to provide a biennial forum for the presentation of multi agent research and development results. With its particular geographical orientation towards Central and Eastern Europe, CEEMAS has become an internationally recognised event with participants from all over the world. After the successful CEEMAS conferences in St Petersburg 1999, Cracow 2001 and Prague 2003, the 2005 CEEMAS conference takes place in Budapest. The programme committee of the conference series consists of established researchers from the region and renowned international colleagues, showing the prominent rank of CEEMAS among the leading events in multi agent systems. In the very competitive field of agent oriented conferences and workshops nowadays, such as AAMAS, WI-IAT, EUMAS, CIA, MATES, the special profile of CEEMAS is that it is trying to bridge the gap between applied research achievements and theoretical research activities. Our ambition is to provide a forum for presenting theoretical research with an evident application potential, implemented application prototypes and their properties as well as industrial case studies of successful but also unsuccessful agent technology deployments. This is why the CEEMAS proceedings volume provides a collection of research and application papers. The technical research paper section of the proceedings, see pages 11-499, contains pure research papers as well as research results in application settings, while

the application papers section see pages 500 530 contains papers focused on application aspects The goal is to demonstrate the real life value and commercial reality of multi agent systems as well as to foster communication between academia and industry in this eld

Agent-Oriented Software Engineering V James Odell, Paolo Giorgini, Jörg, P. Müller, 2005-01-24 The explosive growth of application areas such as electronic commerce enterprise resource planning and mobile computing has profoundly and irreversibly changed our views on software systems Nowadays software is to be based on open architectures that continuously change and evolve to accommodate new components and meet new requirements Software must also operate on different platforms without recompilation and with minimal assumptions about its operating environment and its users Furthermore software must be robust and autonomous capable of serving a naive user with a minimum of overhead and interference Agent concepts hold great promise for responding to the new realities of software systems They offer higher level abstractions and mechanisms which address issues such as knowledge representation and reasoning communication coordination cooperation among heterogeneous and autonomous parties perception commitments goals beliefs and intentions all of which need conceptual modelling On the one hand the concrete implementation of these concepts can lead to advanced functionalities e g in inference based query answering transaction control adaptive workflows brokering and integration of disparate information sources and automated communication processes On the other hand their rich representational capabilities allow more faithful and flexible treatments of complex organizational processes leading to more effective requirements analysis and architectural detailed design

same spirit as its predecessors In particular ESAW2004 took place at the IRI T laboratory of the Université Paul Sabatier Toulouse France at the end of October 2004 It was not located with any other scientific event in the same way as ESAW 2003 ESAW 2004 remained committed to the use of the notion of MASs as the seeds for animated constructive and highly interdisciplinary discussions about technologies methodologies and tools for the engineering of complex distributed systems
