Solar Energy Utilization Robert C. Liu, 1976 **Solar Energy Utilization** Hafit Yüncü, E. Paykoc, Y. Yener, 2012-12-06

Until very recently energy supply of the world has been treated as being nearly inexhaustible. Nowadays about 90 percent of the energy used is obtained from non renewable resources: oil, natural gas, coal, and uranium. These resources are being used up at an alarming rate. To meet our demands we are now searching for new sources of energy. One of these new sources of energy is solar energy which will assume increasing importance. It is free but means must be developed to use it economically. Research is actively under way to reduce the storage cost of this low intensity energy and for the design of economical systems. The purpose of this Institute is to provide an international forum for the dissemination of information on solar energy utilization fundamentals and applications in industry. This meeting is primarily a high level teaching activity. The subject is treated in considerable depth by lecturers eminent in their field. The other participants include scientists, engineers, and senior graduate students who themselves are involved in a similar research and who wish to learn more about current developments as well as scientists from other areas who are planning to research on solar energy. The lectures are supplemented by informal discussions designed to encourage the free and critical exchange of ideas. A limited number of contributions are also included. This volume contains both basic and applied information contributed during the Institute. The editors appreciate the cooperation of Martinus Nijhoff Publishers in making the proceedings widely available.

Solar Thermal Energy Utilization Manfred Becker, 2013-11-11

The energy crisis in 1973 and 1979 initiated a great number of activities and programs for low and high temperature application of solar energy. Synthetic fuels and chemicals produced by solar energy is one of them where temperatures in the range of 600-1000 °C or even higher are needed. In principle such high temperatures can be produced in solar towers. For electricity tower plants production the feasibility and operation of solar Solar Power has been examined during the SSPS project Small System in Almeria, Spain. The objective of Solar Thermal Energy Utilization is to field the experience from the former SSPS program in to the of solar produced synthetic fuels. New materials and technologies have to be developed in order to research this goal. Metallic components now in use for solar receivers need to be improved with respect to transient operation or possibly replaced by ceramics. High temperature processes like steam, methane reforming, coal conversion and hydrogen production need to be developed or at least adapted for the unconventional solar operation. Therefore Solar Thermal Energy Utilization is a long term program which needs time for its development much more time than the intervals expected in between further energy crisis.

The Studies on Technology and Application on Solar Energy Utilization is a necessary step in the right direction in order to prepare for the energy problems in the future.

Engineering Thermodynamics of Thermal Radiation: for Solar Power Utilization Richard Petela, 2010-01-25 Complete coverage of the thermodynamics of radiation matter for solar energy utilization. This comprehensive guide reviews the fundamentals of the thermodynamics of radiation matter, photon gas. The book introduces the exergy of radiation through the most advanced thermodynamic analysis of the solar power processes involving radiation. Engineering Thermodynamics of Thermal Radiation For Solar Power Utilization provides for the first time an exhaustive discussion on energy and exergy analysis of radiation processes. Extensive details on the exergy of radiation are developed for evaluation of the practical uses of radiation. This volume contains quantitative calculation examples for solar heating a solar chimney power plant, photosynthesis and photovoltaic technology. Addressed to researchers, designers and users of different solar installations, the book also has the potential to inspire the development of new applications of radiation exergy. Coverage includes Definitions and laws of substance and radiation. Laws of thermodynamic analysis including energy and exergy analysis. Thermodynamic properties of photon gas. Exergy of emission and arbitrary radiation flux. Energy entropy and exergy radiation spectra of surfaces. Thermodynamic analysis of heat from the sun, a solar chimney power plant, photosynthesis and the photovoltaic.
