

Solid Liquid Equilibrium

The *melting point* of a solid or the *freezing point* of a liquid is the temperature at which the solid and liquid phases coexist in equilibrium.

Molar heat of fusion (ΔH_{fus}) is the energy required to melt 1 mole of a solid substance at its freezing point.

$$\Delta H_{\text{fus}} = -\Delta H_{\text{solid}}$$

has been investigated as a model for systems that form solid solutions Solid and liquid phase compositions in L valine L leucine L valine L isoleucine and L isoleucine L valine in water were measured over the entire range of solid composition and it was shown from mass balance and phase rule considerations that these systems form solid solutions The solid phases resulting from isothermal and cooling crystallization experiments were also investigated using powder x ray diffractometry which showed that homogeneous solid solutions could only be obtained in cooling crystallization experiments whereas isothermal experiments generally produced inhomogeneous solids This suggests that data reported in the literature from isothermal experiments may not represent true equilibrium values Solid phase activity coefficients were estimated using binary and ternary equilibrium data and the UNIFAC Kuramochi model for liquid phase nonidealities The solid phases in the three systems investigated exhibited significant nonidealities that were correlated using the Margules model The model parameters exhibited a linear relationship with the ratio of binary solubilities of the two solutes Such simple relationship may be advantageous when solid liquid equilibrium of thermally unstable solutes or components with unknown physical properties are crystallized **Studies in Natural Solid-liquid Equilibrium** Mark Stefan Ghiorso, 1982 **Scientific Unit**

Modeling of Solid-Liquid

Equilibrium Sunil Maity,2009-10 The knowledge of solid liquid equilibrium SLE and availability of a validated computer based model is of great technical interest for developing and designing separation processes such as crystallization and fractionation and solving industrial problems The latest version of Statistical Associating Fluid Theory SAFT Perturbed Chain SAFT PC SAFT is very much successful for highly non ideal macro molecular weight system such as polymers With the experimental SLE data available in literature for low molecular weight n alkanes and aromatic compounds both at atmospheric and elevated pressure the suitability of the developed SLE model based on PC SAFT was tested Subsequently sensitivity study was performed for polyethylene The solubility of two different grade of polyethylene in mixed xylene was then determined using indigenously developed laser based technique The viscosity average molecular weight specific gravity and melting point of the polyethylene samples were determined using standard technique The validated model was then used to correlate the experimentally determined solubility of polyethylene in xylene
