Summer On The Steppe:

Plant Life of the Dolomites Erika Pignatti, Sandro Pignatti, 2013-12-05 The landscape and vegetation of the Dolomites have characteristics that are very particular. Some 2300 species live here about a fifth of the flora in Europe as a whole. This book depicts what the plant cover of the Dolomites is composed of, how it was formed, and what future evolution may bring. The data presented is based on the authors' combined botanical research, which consists of thousands of surveys throughout the entire region of the Dolomites. To explain the vegetation, 106 plant communities are described in detailed datasheets. Biological, geological, climatic, and physical-chemical parameters are given for each plant community, including a description of the habitat, the indicator species, the floristic composition, distribution, conservation, and alteration risks, as well as a distribution map and a photo of the association. The associations are grouped into habitats such as the human habitat, natural forests, and meadows on the valley floor, the coniferous forest belt, screes, alpine vegetation on granite porphyry and volcanic rock, as well as on dolomite and limestones. In closing, the authors make a case for using the scientific information provided in the book for the conservation of the Dolomites, the heritage of all humanity. Additional in-depth analysis will be presented in the supplementary volumes Plant Life of the Dolomites Vegetation Tables and Plant Life of the Dolomites Atlas of Flora.

Geomorphology of Georgia Levan Tielidze, 2018-05-19 This book provides a comprehensive overview of the geomorphology of Georgia. It describes a country characterized by geological, geomorphological, and geographical diversities located in the Caucasus region at the crossroads of Europe and Asia. This book is based on the results of several years of geomorphological studies and research in Georgia, published for the first time in English, and covers a gap in research in the field of world regional geomorphology. The landscapes of Georgia consist of high glacial mountains, medium and high mountains with deeply fragmented features, narrow and deep gorges and canyons, seaside lowlands, volcanic cones, uplands, and mountain ranges, intermountain plains, hollows, and highlands. The peculiarity of the landscape greatly affects the natural conditions. In several chapters, this book describes the diversity of climate, hydrographic network, vegetation cover, soils, fauna, exogenic processes, natural and anthropogenic landscapes. This volume provides the readers with the opportunity to explore the variety of landscapes and landforms in this diverse and fascinating country through informative texts illustrated with many color maps and photographs. Geomorphology of Georgia appeals to scientists, scholars, teachers, and any readers interested in geology, physical geography, geomorphology, tourism, and environmental protection. It is a rich resource for field trips and a comprehensive guide for travelers interested in the geomorphology of Georgia. **The Industries of Russia**
