Why Does the World Stay Green? TCR White, 2005-10-03 Nearly every form of life has the capacity to multiply and increase at a really astonishing rate Think of plagues of locusts or mice Clearly for the vast majority of animals this does not happen otherwise they would swamp the world and destroy all the plants So why doesn't it happen and why does the world stay green The concept explored in this book contends that animals are not controlled through predation but because plants have outwitted them they cannot obtain enough of the food they must have to reproduce and grow Why Does the World Stay Green explains in simple terms how this comes about in nature and describes some of the many fascinating ways in which animals have evolved to cope with this usually chronic shortage of an essential resource It is fascinating and easy reading for anyone interested in natural history The author TCR White has acted as a strong influence for the last 40 years on the ecological community presenting confronting and at times controversial theories on the limiting role that nitrogen plays in the evolution of life Why Does the World Stay Green reveals this fascinating and important ecological theory **Biology of the Sauropod Dinosaurs** Nicole Klein, 2011 Summarizes the latest research findings on the biology of the sauropod dinosaurs the largest land living animals and covers nutrition physiology skeletal structure and growth
