*The Great Bridge Lowering* Sandra Warren, 1983-08-01      **The Great Bridge** David McCullough, 2001-06 First published in 1972 The Great Bridge is the classic account of one of the greatest engineering feats of all time Winning acclaim for its comprehensive look at the building of the Brooklyn Bridge this book helped cement David McCullough's reputation as America's preeminent social historian Now The Great Bridge is reissued as a Simon Schuster Classic Edition with a new introduction by the author This monumental book brings back for American readers the heroic vision of the America we once had It is the enthralling story of one of the greatest events in our nation's history during the Age of Optimism a period when Americans were convinced in their hearts that all great things were possible In the years around 1870 when the project was first undertaken the concept of building a great bridge to span the East River between the great cities of Manhattan and Brooklyn required a vision and determination comparable to that which went into the building of the pyramids Throughout the fourteen years of its construction the odds against the successful completion of the bridge seemed staggering Bodies were crushed and broken lives lost political empires fell and surges of public emotion constantly threatened the project But this is not merely the saga of an engineering miracle it is a sweeping narrative of the social climate of the time and of the heroes and rascals who had a hand in either constructing or obstructing the great enterprise Amid the flood of praise for the book when it was originally published Newsday said succinctly This is the definitive book on the event Do not wait for a better try there won't be any      Skokomish River Basin Ecosystem Restoration, Mason County, Washington United States. **in the lower Puyallup, White, and Carbon Rivers, western Washington** Jonathan A. Czuba, Christiana R.

Czuba, Christopher S. Magirl, Frank D. Voss, 2010-12-01 Draining the volcanic glaciated terrain of Mount Rainier Washington the Puyallup White and Carbon Rivers convey copious volumes of water and sediment down to Commencement Bay in Puget Sound Recent flooding in the lowland river system has renewed interest in understanding sediment transport and its effects on flow conveyance throughout the lower drainage basin Bathymetric and topographic data for 156 cross sections were surveyed in the lower Puyallup River system by the U S Geological Survey USGS and were compared with similar datasets collected in 1984 Regions of significant aggradation were measured along the Puyallup and White Rivers Between 1984 and 2009 aggradation totals as measured by changes in average channel elevation were as much as 7 5 6 5 and 2 feet on the Puyallup White and Carbon Rivers respectively These aggrading river sections correlated with decreasing slopes in riverbeds where the rivers exit relatively confined sections in the upper drainage and enter the relatively unconstricted valleys of the low gradient Puget Lowland Measured grain size distributions from each riverbed showed a progressive fining downstream Analysis of stage discharge relations at streamflow gaging stations along rivers draining Mount Rainier demonstrated the dynamic nature of channel morphology on river courses influenced by glaciated volcanic terrain The greatest rates of aggradation since the 1980s were in the Nisqually River near National 5 0 inches per year and the White River near Auburn 1 8 inches per year Less pronounced aggradation was measured on the Puyallup River and the White River just downstream of Mud Mountain Dam The largest measured rate of incision was measured in the Cowlitz River at Packwood 5 0 inches per year Channel conveyance capacity estimated using a one dimensional hydraulic model decreased in some river reaches since 1984 The reach exhibiting the largest decrease about 20 50 percent in channel conveyance capacity was the White River between R Street Bridge and the Lake Tapps return a reach affected by recent flooding Conveyance capacity also decreased in sections of the Puyallup River Conveyance capacity was mostly unchanged along other study reaches Bedload transport was simulated throughout the entire river network and consistent with other observations and analyses the hydraulic model showed that the upper Puyallup and White Rivers tended to accumulate sediment Accuracy of the bedload transport modeling however was limited due to a scarcity of sediment transport data sets from the Puyallup system mantling of sand over cobbles in the lower Puyallup and White Rivers and overall uncertainty in modeling sediment transport in gravel bedded rivers Consequently the output results from the model were treated as more qualitative in value useful in comparing geomorphic trends within different river reaches but not accurate in producing precise predictions of mass of sediment moved or deposited The hydraulic model and the bedload transport component were useful for analyzing proposed river management options if surveyed cross sections adequately represented the river management site and proposed management options The hydraulic model showed that setback levees would provide greater flood protection than gravel bar scalping after the initial project construction and for some time thereafter although the model was not accurate enough to

quantify the length of time of the flood protection The greatest hydraulic benefit from setback levees would be a substantial increase in the effective channel conveyance area By widening the distance between levees the new floodplain would accommodate larger increases in discharge with relatively small incremental increases in stage Model simulation results indicate that the hydraulic benefit from a setback levee also would be long lived and would effectively compensate for increased deposition within the setback reach from increased channel conveyance capacity In contrast the benefit from gravel bar scalping would be limited by the volume of material that could be removed and the underlying hydraulics in the river section that would be mostly unaffected by scalping Finally the study formulated an explanation of the flooding that affected Pacific Washington in January 2009 Reduction in channel conveyance capacity of about 25 percent at the White River near Auburn streamflow gaging station between November 2008 and January 2009 was caused by rapid accumulation of coarse grained sediment just downstream of the gage continuing an ongoing trend of aggradation that has been documented repeatedly
