Durrant,2012-12-06 At the XV General Assembly of the International Astronomical Union in Sydney 1973 Commission 10 for
Solar Activity requested the incoming Organising Committee to establish a small group to recommend a standard
nomenclature for solar features and to prepare an illustrated text which would clear the jungle of terms for the benefit of
solar physicists as well as of theoreticians and research workers in related fields The challenge was taken up by the president
of Commission 10 Prof K O Kiepenheuer and his persuasive advocacy has led eventually to the present book In the course of
the work the declared aim but not the basic purpose was revised Rather than prepare a list of standard terms we have
preferred to collect together all the terms that appear in current English language literature Synonyms and partially
overlapping terms are all recorded for the most part without prejudice Each has been defined as exactly as possible with the
hope that in the future they may be used and understood without ambiguity It would be a step on the road to standardisation
if these terms were not re used for new phenomena New observations and new theories will lead to reappraisals and
redefinitions so the Glossary is intended more as a guide to the present situation than as a rule book Key Processes in

participants from 19 countries met at the Itamambuca resort area of Ubatuba Sao Paulo Brazil to discuss the influence of
solar variability on geophysical and heliospheric phenomena at a conference organized by the International Living With a

Carovillano,J.M. Forbes,2012-12-06 The Theory Institute in Solar Terrestrial Physics was held at Boston College 19 26 August
1982 The program consisted of a two week School followed by the first theory conference in the field This book is based upon
the lectures presented at the School Several years ago there was a convergence of efforts to promote the role of theory in
space plasma physics Reports from the National Academy of Sciences and NASA advisory committees documented the

disciplinary maturity of solar terrestrial physics and recommended that theorists play a greater role in the continued development of the field. The so called theory program in solar terrestrial physics was established by NASA in 1979 and implemented in accordance with the guidelines set forth by a panel of scientists primarily theorists in the field. The same panel motivated the Boston College program. Published proceedings of the school would provide curricular materials for the training of graduate students in solar terrestrial physics. J. M. Forbes, T. E. Holzer, A. J. Hundhausen, A. D. Richmond, and G. L. Siscoe were the principal architects of the curriculum of the School and I am grateful for their contributions. Each also lectured at the School. The chapters in this book were prepared by the authors themselves with one exception. The chapters by Parker are edited reproductions of his lectures. Unfortunately it is our loss that the lectures of Holzer and Hundhausen are not included in the book.

Solar Terrestrial Physics: The Study of Mankind's Newest Frontier

Solar Terrestrial Physics STP has been around for 100 years. However it only became known as a scientific discipline under that name when the physical domain studied by STP became accessible to in situ observation and measurement by man or man made instruments. Indeed it was STP that provided the initial scientific driving force for the launching of man made devices into extra terrestrial space during the International Geophysical Year aided of course by the genetically engrained drive of humans to expand their frontiers of knowledge influence and dominance. We may define STP as the discipline dealing with the variable components of solar corpuscular and electromagnetic emissions the physical processes governing their sources and their propagation through interplanetary space and the physical chemical processes related to their interaction with the Earth and other bodies in interplanetary space. Much of STP deals with fully or partially ionized gas flows and related energy momentum and mass transfer in what now appears as one single system made up of distinct but strongly interacting parts reaching from the photosphere out to the confines of the heliopause engulfing planets and other solar system bodies and dipping deep into the Earth's atmosphere.
