

is interrupted for more than 60 minutes (45 min. in hot weather), a construction joint has to be made.

Upon a long-lasting defect of the paving equipment, the supply of fresh concrete has to be stopped immediately and an attempt must be made to complete the current paving phase. If the circumstances and the elapsed workability time no longer make a proper completion possible, the concrete, that has been deposited but not yet finished, has to be removed.

To achieve a continuous profile, particular care is taken of the execution of the construction joints, both at the end of the day and every time work is resumed. The concrete is compacted preferably with a separate vibrating needle before the paving machine is passing in order to obtain properly compacted concrete on both sides of the joint.

PLACEMENT OF CONCRETE ON A SLOPE

When placing concrete on a slope of less than 4 % it is recommended to work uphill, in order to prevent tension cracks at the surface. Furthermore, the consistency of the concrete and the working speed of the paver have to be adapted to the working conditions.

However, if the longitudinal slope is more than 4 %, unevenness can occur as concrete falls back when the machines have passed. In that case, a suitable composition of the concrete mix has to be realized and it is recommended to work downhill. It must be ensured that enough concrete is deposited in front of the paving machine to prevent the concrete from sliding down. Concrete pavements have been successfully executed on slopes of 10 to 12 %. At one time the slope was even 18 %.

OPENING TO TRAFFIC

Usually, a concrete pavement is only opened to traffic 7 days after the concrete has been laid and after, in the presence of all parties, any possible cracks have been recorded. A concrete pavement of less than 7 days old, can be opened to traffic if the contractor provides proof that the concrete has reached the minimum compressive strength stipulated in the specifications.

Presently, special compositions of the concrete mix allow an early opening to traffic, i.e. between 24 and 48 hours after placement. These mixes are used, for example, for pavement repair works to reduce the nuisance to the public as much as possible.

It is pointless to talk about quality if not all employees, each at his own level, make a special effort to understand the rules of good practice, upgrade their know-how and act accordingly.

COST ANALYSIS OF RIGID PAVEMENTS

The selection criteria of type of pavement, flexible or rigid, should be based not on the initial cost of construction but life cycle cost, which includes the discounted maintenance and pavement strengthening costs that are incurred during the design life of the pavement.
