*Smoking has a  
significant effect on  
reproductive and  
child health.*

An estimated 44.5 million adults in the USA smoke cigarettes, and tobacco use is the leading preventable cause of death in that country. Cigarette smoking during pregnancy continues to be a significant public health concern. Despite decreases in the percentage of women who smoked during pregnancy in the 1990s, the Centres for Disease Control and Prevention reported that 11.4% of mothers who gave birth during 2002 smoked. A South African study reported that 39% of pregnant women smoked, with considerable variation between racial groups.

It is known that smoking in pregnancy is associated with a number of adverse outcomes, including low birth weight, abruptio placentae, miscarriage, premature delivery and an increase in

perinatal mortality. In addition, smoking affects the gametes and ovarian function, which can impair fertility, as well as having more long-lasting effects such as an earlier onset of menopause. It is also an important co-factor in the genesis of cervical cancer, one of the major health concerns in women in South Africa. This review discusses the effects of cigarette smoking on reproductive health issues.

## EXPOSURE

Cigarette smoke contains over a thousand different compounds, including carbon monoxide, nicotine, polycyclic aromatic hydrocarbons (PAHs), nitroso compounds, aromatic amines, protein pyrolysates and trace elements such as cadmium and nickel. Two major mutagenic compounds are nitrosamines and PAHs. The two

**Men's Reproductive and Sexual Health Throughout the Lifespan** Douglas T. Carrell,Alexander W. Pastuszak,James  
M. Hotelling,2023-11-16 Approximately one in twenty men have sperm counts low enough to impair fertility but little progress  
has been made in answering fundamental questions in andrology or in developing new diagnostic tools or management  
strategies in infertile men Many of these problems increase with age leading to a growing population of men seeking help To  
address this there is a strong movement towards integrating male reproductive and sexual healthcare involving clinicians  
such as andrologists urologists endocrinologists and counselors This book will emphasize this integrated approach to male  
reproductive and sexual health throughout the lifespan Practical advice on how to perform both clinical and laboratory  
evaluations of infertile men is given as well as a variety of methods for medically and surgically managing common issues  
This text ties together the three major pillars of clinical andrology clinical care the andrology laboratory and translational  
research **Analyzing Male Reproductive Risk, Understanding Molecular Targets, and Developing Treatments**

Xiang Xiao,Cibele S. Borges,Huitao Li ,C. Yan Cheng,2024-07-10 Male fertility both resilient and fragile is heavily affected by  
external factors such as the environment drug use and eating habits in a similar way to a wall of stone that is constantly  
attacked and weathered to varying degrees The use of cancer drugs for instance may increase life expectancy and cure  
diseases but may also negatively affect male fertility A variety of factors complicate male infertility such as the intricate  
spermatogenesis process The available methods for diagnosis are limited not to mention treatment However some evidence  
showed that different reproductive physiologies may share some biological basis and thus molecular pathways such as mTOR  
which plays a role in testis physiology Sertoli cell function transcriptional and translational control of spermatogenesis as  
well as drug and environmental exposure Moreover male fertility can also reflect men s overall health and the likelihood of  
suffering from certain diseases suggesting that these events have common regulatory mechanisms This Research Topic aims  
to identify these potential shared mechanisms analyze and explore how environment disease drug use and nutritional  
supplements affect male fertility as well as reveal the seemingly chaotic but traceable phenomena It will be crucial for the  
development of diagnostics treatments and maintenance methods needed to enhance male fertility which is also the objective

of this research topic This Research Topic encourages Original Research Reviews and other accepted article types including but not limited to Analyses of the possible effects of environmental pollutants brought about by industry and human activities such as endocrine disrupting chemicals EDCs on male reproduction Links between men s overall health and fertility as well as andrological effects of various illnesses including infectious diseases deficiencies hereditary diseases and physiological disorders Effects of medications and dietary supplements on male reproductive systems such as those used for cancer treatment psychiatric disorders diabetes etc The use of herbal and medicinal remedies to prevent or reverse adverse andrological effects caused by putative toxic chemicals and diseases Specific molecular mechanisms and signalling pathways that affect spermatogenesis the testis and sperm function associated with the above 4 points Shared molecular mechanisms underlying both the generation and remission of male infertility disease
