Topology Optimization Theory for Laminar Flow Yongbo Deng,Yihui Wu,Zhenyu Liu,2017-09-27 This book presents the topology optimization theory for laminar flows with low and moderate Reynolds numbers based on the density method and level set method respectively The density method based theory offers efficient convergence while the level set method based theory can provide an accurate mathematical expression of the structural boundary Unsteady body force driven and two phase properties are basic characteristics of the laminar flows The book discusses these properties which are typical of microfluidics and one of the research hotspots in the area of Micro Electro Mechanical Systems MEMS providing an efficient inverse design approach for microfluidic structures To demonstrate the applications of this topology optimization theory in the context of microfluidics it also investigates inverse design for the micromixer microvalve and micropump which are key elements in lab on chip devices **Boundary Value Problems with Equivalued Surface and Resistivity Well-Logging**

T Li,Songmu Zheng,Yong-Si Tan,Weixi Shen,1998-03-25 This first part of this book deals with the boundary value problem with equivalued surfaces while the second part is concerned with the mathematical model and method including the numerical method of the resistivity well logging for the three lateral well logging **Analysis and Applications** H. P. Dikshit,Pawan K. Jain,2003-01-29 Analysis and its applications have been major areas for research in mathematics and allied fields The fast growing power of computation has made a significant and useful impact in these areas This has lead to computational analysis and the emergence of fields like Bezier Bernstein methods for computer aided geometric design constructive approximation and wavelets and even computational harmonic analysis Analysis and Applications consists of research articles including a few survey articles by eminent mathematicians projecting trends in constructive and

Regularization of Ill-Posed Problems by Iteration Methods S.F. Gilyazov, N.L. Gol'dman, 2013-04-17 Iteration

regularization i.e. utilization of iteration methods of any form for the stable approximate solution of ill posed problems is one of the most important but still insufficiently developed topics of the new theory of ill posed problems In this monograph a general approach to the justification of iteration regularization algorithms is developed which allows us to consider linear and nonlinear methods from unified positions Regularization algorithms are the classical iterative methods steepest descent methods conjugate direction methods gradient projection methods etc complemented by the stopping rule depending on level of errors in input data They are investigated for solving linear and nonlinear operator equations in Hilbert spaces Great attention is given to the choice of iteration index as the regularization parameter and to estimates of errors of approximate solutions Stabilizing properties such as smoothness and shape constraints imposed on the solution are used On the basis of these investigations we propose and establish efficient regularization algorithms for stable numerical solution of a wide class of ill posed problems In particular descriptive regularization algorithms utilizing a priori information about the qualitative behavior of the sought solution and ensuring a substantial saving in computational costs are considered for model and applied problems in nonlinear thermophysics The results of calculations for important applications in various technical fields a continuous casting the treatment of materials and perfection of heat protective systems using laser and composite technologies are given
