

Answers to questions

1. Use the gradients of the lines of fit and calculate the difference between them. Divide the difference by the gradient of the line of best fit and express the answer as a percentage. The computed value for $\frac{M}{g}$ should lie within the uncertainty.
2. Friction will oppose the motion with the result that the force acting will be reduced, and so the velocity at the light gate will be reduced. This will make the gradient smaller.
3. By using the air track, where there is no contact but considerable air resistance. Or, trolleys can be friction compensated by giving them a downward slope. The slope should be adjusted so that the trolley, when pushed, runs at a constant speed. The success can be judged in part by the percentage uncertainty in Q1.
4. Students should consider how to use the centre's apparatus more effectively. For example, they could discuss the use of a datalogger and multiple light gates.
5. Students may consider the kinetic energy and calculate the transfer from gravitational potential energy as the mass falls.

Sample data

Mass of trolley, all masses (constant total), string etc. = 0.717 kg

m/kg	T/s	$v/\text{m s}^{-1}$	$mT/\text{kg s}$
0.010	3.80	0.340	0.0380
0.015	2.90	0.455	0.0435
0.020	2.44	0.532	0.0488
0.025	2.17	0.579	0.0543
0.030	1.98	0.644	0.0594
0.035	1.79	0.704	0.0627

The graph of mT against v gives a gradient of 0.0713

Calculated value of $\frac{M}{g} = 0.0731$

% difference = 2.5%

Technician Physics Eric Deeson, 1984 Organic Chemistry for Higher Education John Brockington, Peter Stamper, 1982 *An Introduction to Radiation Protection* Alan Martin, Sam Harbison, Karen Beach, Peter Cole, 2018-10-25

This highly readable account of the nature of the hazards presented by ionizing radiation and the methods of protection is an ideal introductory text for those new to the field and for the non specialist. The seventh edition continues to cover the technical principles underlying the control of radiation hazards, radiation detection and measurement and the biological effects of radiation, followed by a consideration of industry specific radiation protection issues. Further specialised topics include risk assessment, waste management and decommissioning, radiological emergencies, relevant legislation and organizational issues and new to this edition, environmental radiation protection.

Inorganic Chemistry for Higher Education John Brockington, Peter Stamper, 1983 *Quantum (Un)speakables* R.A. Bertlmann, A. Zeilinger, 2013-11-11

Issues raised by quantum theory, a topic not very popular during his student days at Queen's University Belfast. Apparently John Bell, who had been interested in the Bohr-Einstein dialogue, always took the position of Albert Einstein on philosophical issues. He also felt that a completion of quantum mechanics using so-called hidden variables would be highly desired as it would help to regain a realistic and objective picture of the world. That way Bell hoped one would be able to arrive at a physics where measurement would not play such a central role as in the Copenhagen interpretation of quantum mechanics. Then a most interesting sequence of events set in. In 1952 David Bohm had achieved something which had earlier been proclaimed impossible. It had been proved by John von Neumann that no hidden variable theory could agree with quantum mechanics. Bohm actually formulated such a theory where each particle at any time has both a well-defined position and a well-defined momentum. The conflict raised between von Neumann and Bohm was elegantly resolved by Bell, who showed that von Neumann's proof contained a physically unjustifiable assumption. So while John Bell had flung open the door widely for hidden variable theories, he immediately dealt them a major blow. In 1964 in his celebrated paper 'On the Einstein-Podolsky-Rosen Paradox' he showed that any hidden variable theory which obeys Einstein's requirement of locality is impossible. **NUREG/CR.**
