

Technical change in Latin American agriculture

A conceptual framework for its interpretation

Martin Piñeiro, Eduardo Trigo and Raul Florentino

The authors present a critical analysis of the ideas dominating current discussions on technological development in Latin America, and introduce a methodological framework of their own. Their perspective views technology as a social phenomenon, and incorporates social conflicts and the role of the state as variables in an analysis of technical change in agriculture.

M. Piñeiro is coordinator, and E. Trigo and R. Florentino are members of the coordinating team, of the Proyecto Cooperativo de Investigación sobre Tecnología Agropecuaria en América Latina (PROTAGAL) of the Instituto Interamericano de Ciencias Agrícolas (IICA), and can be reached at: Sede Central del IICA, Apartado No. 10201, San José, Costa Rica. The project is developed with the sponsorship and financial support of the Ford Foundation, Instituto Colombiano Agropecuario, UNDP and IDRC of Canada and with the participation of a number of independent national research teams. The ideas presented in this paper are the authors' and do not necessarily represent those of the sponsoring institutions.

The figures for production and land productivity of major crops in Latin America show relatively low aggregate growth rates, particularly when these rates are defined in per capita terms. However, the most outstanding feature of past agricultural performance in the region is the considerable variability of growth rates between crops within any one country, and among countries for most major crops. Furthermore, a careful consideration of production conditions tends to suggest that this variability cannot be explained by differences in natural resource endowments or strictly technological elements, such as available technology.

This article provides a conceptual framework for the analysis of technical change which, by incorporating social conflicts and the role of the state as explicit and important variables, attempts to account for the observed variability in production and productivity performance. The basic analytical shortcomings of the most important ideas that dominate the present discussion on technological development in Latin America will be analysed. A methodological perspective will then be presented which attempts to provide for an adequate interpretative framework for understanding technological change in Latin America. This perspective implies that technology is basically a social phenomenon and as such it must be studied and interpreted as an endogenous element to the general behaviour of the social system.

Food production: the role of technology

Food production in Latin America has expanded during the past 25 years at an annual rate of about 3.0%, a rate just about equal to population growth, but lower than that experienced in other continents. About one third of the growth is due to horizontal expansion rather than to increments in crop yields.¹
