

The background of the book cover is a composite of microscopic tissue images. The top half features a dense network of reddish-brown, branching structures, likely representing connective tissue or a vascular network. The bottom half shows a more complex arrangement with blue-stained, elongated cells and fibers, possibly representing muscle or neural tissue. The overall effect is a detailed, scientific representation of human anatomy at the cellular level.

the genesis of life and throughout the course its further evolution Nature has constantly been called upon to act as an
engineer in solving technical problems Organisms have evolved a variety of well defined shapes and structures Although
often intricate and fragile they can nonetheless deal with extreme mechanical loads Some organisms live attached to a
substrate others can also move fly swim and dive These abilities and many more are based on a variety of ingenious
structural solutions Understanding these is of major scientific interest since it can give insights into the workings of Nature
in evolutionary processes Beyond that we can discover the detailed chemical and physical properties of the materials which
have evolved can learn about their use as structural elements and their biological role and function This knowledge is also
highly relevant for technical applications by humans Many of the greatest challenges for today s engineering science involve
miniaturization Insects and other small living creatures have solved many of the same problems during their evolution
Zoologists and morphologists have collected an immense amount of information about the structure of such living
micromechanical systems We have now reached a sophistication beyond the pure descriptive level Today advances in physics
and chemistry enable us to measure the adhesion friction stress and wear of biological structures on the micro and
nanonewton scale Furthermore the chemical composition and properties of natural adhesives and lubricants are accessible to
