

Description: A *text concordance* is an alphabetical listing of all the distinct words in a document. The basic storage structure for a *concordance* is an array of Binary Search Trees, one tree for words starting with A, one for words starting with B, etc.

In C++ you will write a program that reads a text file and constructs the *concordance* that contains the distinct words in the file **and**, **for each word, the line number of the first occurrence, and how many there are in the file then allows the user to search the *concordance* for a particular word, and to print out a list of all the distinct words in the *concordance*.**

- Words that are upper case (or have uppercase letters in them) are treated the same as the word written with all lowercase letters.
- Words in the list will NOT have ANY non-alphabetic characters at the beginning or end of the word
 - i.e. the word **hello!!** and the word **---Hello** will both be saved as the word **hello**
- The program will ask the user to input the file name at run-time
- The program will ask the user for words to search for until the user indicates they are done
- After searching for words, the program will display a list of the distinct words in alphabetical order, the line number of their first occurrence, and how many there are in the file
