The Neuropsychology Handbook Dr. Danny Wedding, PhD, MPH, 2007-10-18 A fantastic and monumental contribution to our field Ralph M Reitan PhD The field of neuropsychology has many specialized books on particular diseases but there is always a need for a general text to cover the major aspects of neuropsychology from neuroanatomy to assessment to practice issues This is one such book that attempts to provide comprehensive coverage of the field Doody s In the last decade the number of books courses training opportunities and journals dealing with clinical neuropsychology has greatly increased Demand for a complete reference in the field is growing as practitioners in private practice the court system and the medical field continue to make discoveries and advance our knowledge of the brain system and how it affects our everyday lives In order to address this urgent need Drs Horton and Wedding have edited this Third Edition of the classic Neuropsychology Handbook In its pages are reviews of all the major areas in which clinical neuropsychologists work the foundations of clinical neuropsychology brain structure and function neurological disorders psychiatric disorders diagnostic decision making symptom validity testing neuroimaging behavioral change following traumatic brain injury disability determination rehabilitation planning and more Very specialized areas of practice such as clinical neuropsychology with children clinical neurotoxicology and neuropsychological assessment in criminal law cases also receive chapters

Handbook of Neuropsychological Assessment Antonio E. Puente, Robert J. McCaffrey, 2013-11-11 The growth of clinical neuropsychology has been unprecedented This growth has been oriented more toward the provision of than toward the foundation for services Thus while a greater number of psychologists are performing a greater number of neuropsychological procedures there seems to us an uneven parallel growth between these services and the empirical foundations for them It should come to no one s surprise that increasingly aggressive attacks on the field have been leveled Despite these attacks

clinical neuropsychology continues to enjoy exceptional growth within psychology and acceptance by other health practitioners insurance companies legislators judges juries and above all consumers of our services Growth without self reflection is a dangerous enterprise as is growth without directions We find it disconcerting that existing and limited self analysis has assumed that neuropsychological dysfunction is immune to the same variables that affect psychological dysfunction Some attention has been paid to the most obvious ones such as age but all others have been ignored and or misunderstood This neglect has spawned a body of knowledge replete with questionable data and unfounded conclusions Hence it is surprising that clinical neuropsychologists consider themselves to be more scientifically sound than their regular clinical counterparts

Neuropsychology Gerald Goldstein, Paul David Nussbaum, Sue R. Beers, 2013-06-29 In this volume of the series Human Brain Function Assessment and Rehabilitation we cover the area of how brain function is assessed with behavioral or neuropsychological instruments These assessments are typically conducted by clinical neuropsychologists or behavioral neurologists and so we made an effort to present the somewhat differing approaches to these two related disciplines Clinical neuropsychologists are psychologists who typically utilize standardized tests while behavioral neurologists are physicians who generally assess brain function as part of the clinical neurological evaluation Both approaches have much to offer The basic assumption of neuropsychological assessment is that the brain is the organ of behavior and therefore the condition of the brain may be evaluated with behavioral measures Neuropsychological tests are those measures found by research to be particularly sensitive to alterations in brain function An adequate neuropsychological test is a procedure that can be related to some objective measure of alteration in brain function Over the years these objective measures have changed but generally involve documentation through direct observation of brain tissue or through histological pathological neuroimaging or other laboratory procedures The methods described in the first two volumes of this series describe the neuroimaging procedures that are often used in the validation of neuropsychological tests
