

Secondary somatic embryogenesis

- Secondary SE is a process in which **new somatic embryos are proliferated from originally formed primary somatic embryos.**
- Secondary SE have some advantage over primary somatic embryogenesis, such as **high multiplication rate, long term repeatability and independency of an explant source.**
- Secondary SE also **overcomes post fertilization barriers of the embryo,** immature embryos of interspecific plants from incompatible crosses may be rescued by culturing them for secondary SE.
- It can also be used for the production of somatic embryos of species in which the embryos are **the reservoir of important secondary metabolites.**

Alatar,2019-11-23 This book introduces the reader to synthetic or artificial seeds which refer to alginate encapsulated somatic embryos vegetative buds or any other micropropagules that can be used as seeds and converted into plantlets after propagating under in vitro or in vivo conditions Moreover synthetic seeds retain their potential for regeneration even after low temperature storage The production of synthetic or artificial seeds using micropropagules opens up new vistas in agricultural biotechnology Encapsulated propagules could be used for in vitro regeneration and mass multiplication at reasonable cost In addition these propagules may be used for germplasm preservation of elite plant species and the exchange of plant materials between national and international laboratories This book offers state of the art findings on methods applications and prospects of synthetic or artificial seeds *Somatic Embryogenesis and Synthetic Seed I* Professor Dr. Y. Krishnamurthy, 2015-07-02 This volume offers a much needed compilation of essential reviews on diverse aspects of plant biology written by eminent botanists These reviews effectively cover a wide range of aspects of plant biology that have contemporary relevance At the same time they integrate classical morphology with molecular biology physiology with pattern formation growth with genomics development with morphogenesis and classical crop improvement techniques with modern breeding methodologies Classical botany has been transformed into cutting edge plant biology thus providing the theoretical basis for plant biotechnology It goes without saying that biotechnology has emerged as a powerful discipline of Biology in the last three decades Biotechnological tools techniques and information used in combination with appropriate planning and execution have already contributed significantly to economic growth and development It is estimated that in the next decade or two products and processes made possible by biotechnology will account for over 60% of worldwide commerce and output There is therefore a need to arrive at a general understanding and common approach to issues related to the nature possession conservation and use of biodiversity as it provides the raw material for biotechnology More than 90% of the total requirements for the biotechnology industry are contributed by plants and microbes in terms of goods and services There are however substantial plant and microbial resources that are waiting for biotechnological exploitation in the near future through effective bioprospection In order to exploit plants and microbes for their useful products and processes we need to first understand their basic structure organization growth and development cellular process and overall biology We also need to identify and develop strategies to improve the productivity of plants In view of the above in this two volume book on plant biology and biotechnology the first volume is devoted to various aspects of plant biology and crop improvement It includes 33 chapters contributed by 50 researchers each of which is an expert in his her own field of research The book begins with an introductory chapter that gives a lucid account on the past present and future of plant biology thereby providing a perfect historical foundation for the chapters that follow Four chapters are devoted to details on the structural and developmental aspects of the structures of plants and their principal organs These chapters provide the molecular biological basis for the regulation of morphogenesis

of the form of plants and their organs involving control at the cellular and tissue levels Details on biodiversity the basic raw material for biotechnology are discussed in a separate chapter in which emphasis is placed on the genetic species and ecosystem diversities and their conservation Since fungi and other microbes form an important component of the overall biodiversity special attention is paid to the treatment of fungi and other microbes in this volume Four chapters respectively deal with an overview of fungi arbuscularmycorrhizae and their relation to the sustenance of plant wealth diversity and practical applications of mushrooms and lichens associated with a photobiont Microbial endosymbionts associated with plants and phosphate solubilizing microbes in the rhizosphere of plants are exhaustively treated in two separate chapters The reproductive strategies of bryophytes and an overview on Cycads form the subject matter of another two chapters thus fulfilling the need to deal with the non flowering Embryophyte group of plants Angiosperms the most important group of plants from a biotechnological perspective are examined exhaustively in this volume The chapters on angiosperms provide an overview and cover the genetic basis of flowers development pre and post fertilization reproductive growth and development seed biology and technology plant secondary metabolism photosynthesis and plant volatile chemicals A special effort has been made to include important topics on crop improvement in this volume The importance of pollination services apomixes male sterility induced mutations polyploidy and climate changes is discussed each in a separate chapter Microalgalnutra pharmaceuticals vegetable oil based nutraceuticals and the importance of alien crop resources and underutilized crops for food and nutritional security form the topics of three other chapters in this volume There is also a special chapter on the applications of remote sensing in the plant sciences which also provides information on biodiversity distribution The editors of this volume believe the wide range of basic topics on plant biology that have great relevance in biotechnology covered will be of great interest to students researchers and teachers of botany and plant biotechnology alike

N. Suresh, S. Geethalakshmi, M. Ilangovan, Niranjan V Das, Prem Jose Vazhacharickal, Mirabilis jalapa a perennial herbaceous bushy plant that reaches stature heights of mostly 1 meter rarely up to 2 meters in height It may also be grown as an annual especially in the temperate zone The single seeded fruits are spherical wrinkled and black upon maturity having started out greenish yellow

The stems are thick full quadrangular with many ramifications and rooting at the nodes The posture is often prostrate A curious aspect of *M. jalapa* is that flowers with different colors grow simultaneously on the same plant Additionally an individual flower can be splashed with different colors Flower patterns are referred to as sectors whole sections of flower flakes stripes of varying length and spots A single flower can be plain yellow red magenta pink or white or have a combination of sectors flakes and spots Furthermore different combinations of flowers and patterns can occur on Artificial seeds are the living seed like structure which are made experimentally by a technique where somatic embryoids derived from plant tissue culture are encapsulated by a hydrogel and such encapsulated embryoids behave like true seeds if grown in soil and can be used as a substitute of natural seeds different flowers of the same plant The viability of the artificial seeds depend on several factors related to conditions of storing the seeds and parts of the flower from which the explant is obtained The protoplast is prepared from several parts like flower leaf stem root buds and meristem These explants are grown in different concentrations of sucrose like 5% 10% 15% 20% 25% 30% 35% 40% 45% 50% The production of synthetic seeds are also studied in this experiment
