Abstract

All astronomical bodies originate inside clouds of gas and dust, therefore there should be a common process that leads to their condensation. In a galactic cloud there is always a gradient of speeds from point to point. Thanks to it, vortices originate that take the material of the surrounding cloud gradually forming large gaseous disks, inside which vortices of second order develop that concentrate the matter of their orbits forming smaller and much denser disks, within which third order vortices further concentrate the matter. The dense cores of these vortices finally condense in massive bodies: sun, planets and satellites. The result should be a well ordered planetary system with no "detritus" around and where both planets and satellites obey to a precise rule of the distances from their central body. The solar system complies with these conditions with three main exceptions. First, in an orbit where a large planet should be there is only a huge number of scattered asteroids. Second, Earth and its moon with all evidence were not formed in the same vortex, which means that Moon originated somewhere else. Third, Neptune's satellite system has been shattered by the intrusion of a foreign body, Triton, and its largest satellites are moving. These exceptions seem to be strictly connected to each other and all due to a unique event, that is: Triton has diverted the largest Neptune satellite towards the sun. This satellite impacted at high speed against the moving planet, scattering myriads of fragments from its mantle and pushing it towards the sun, where it eventually fell. The planet had at least 4 satellites some of which remained in their previous orbit, but two of them were dragged towards the sun and were captured by Earth. The largest became its lonely moon while the second fell on its surface giving origin to the continents. This event happened about 3.56 billion of years ago, as it is proved by the ages of the numerous samples brought from the moon.

Keywords: Galactic Cloud, Moon, Planetsimals, Satellites

Introduction

The current theory about the origin of our moon maintains that it was formed by material removed from Earth by a catastrophic impact with a foreign body. Not a very convincing hypothesis because, among other things, it assumes that our satellite was born as a result of an extraordinary and unrepeatable event not applicable to other similar satellites of the solar system [1].

No more convincing are the theories about the origin of the other satellites and even less those about the formation of the planets and the stars [2-4]. For each of them, in fact, different explanations are provided, which seems unlikely. All astronomical bodies, in the end, originate from clouds of gas and dust. The process that leads to their condensation within these clouds should be the same regardless of their size.

web this lesson goes through the formulas used to calculate the measures of angles created from secants and tangents in circles

secants tangents and angle measures examples solutions - Sep 21 2023

web three points are covered 1 secants that intersect in a circle which divide each other proportionally 2 the angle formed by secants which intersects in a circle and is half the sum of the intercepted arcs 3 two secants drawn from the same point outside a circle that form an angle whose measure is half the difference of the intercepted arcs

tangents secants arcs and angles mathwarehouse com - Oct 22 2023

web the measure of an angle formed by a secant and a tangent drawn from a point outside the circle is 1 2 1 2 the difference of the intercepted arcs remember that this theorem only used the intercepted arcs therefore the red arc in the picture below is not used in this formula case ii 2 secants

secants tangents and angle measures youtube - Jun 18 2023

web secants tangents and angle measures then definition of a secant as well as how to find the measure of an angle if its vertex is inside outside or on a circle show more

secants tangents and angle measure sas pdesas org - May 17 2023

web angle formed by a secant and a tangent the measure of the angle between two tangents or between a tangent and a secant is half the difference of the intercepted arcs angle formed by two chords the measure of an angle formed by two intersecting chords is one half the sum of the measures of the area intercepted by it and its vertical angle
