George Chapline

The Hidden Factor:

The Hidden Factor Steven Skaggs, 2023-11-21 An exquisitely illustrated introduction to the gestural mark in the designed world exploring the tension between marks which are felt and images and words which are conceptual In *The Hidden Factor* Steven Skaggs provides a beautifully illustrated and explained introduction to the mark from those as physical as a scratch made by an animal to those as accidental as a splatter of paint to those as intentional as hand drawn characters Skaggs makes the case that in the visual arts gestures and mark making operate on an equal level with image and word While we might think of content as that which is communicated through text and images Skaggs shows through visual examples that the gestural mark is often hidden within both images and the typographic forms that convey words By mapping different kinds of marks and showing how marks combine with image and word *The Hidden Factor* explains that our desire for conceptual information suppresses our awareness of marking This is especially the case with the tension between word and mark where we desire legibility As a result one of the most conservative of arts calligraphy has the potential of being the most radical since gesturally expressive handwriting is a natural threat to the legibility of a text Filled with expressive calligraphic art graffiti and other gorgeous marks *The Hidden Factor* is an eye opening read that brings to the fore the importance and indeed the prevalence of the mark in everything we see

Intelligence, Motion Vladimir J. Lumelsky,2005-11-28 A leap forward in the field of robotics Until now most of the advances in robotics have taken place in structured environments Scientists and engineers have designed highly sophisticated robots but most are still only able to operate and move in predetermined planned environments designed specifically for the robots and typically at very high cost This new book takes robotics to the next level by setting forth the theory and techniques needed to achieve robotic motion in unstructured environments The ability to move and operate in an arbitrary unplanned environment will lead to automating a wider range of new robotic tasks such as patient care toxic site cleanup and planetary exploration The approach that opens the door for robots to handle unstructured tasks is known as Sensing Intelligence

Motion SIM which draws from research in topology computational complexity control theory and sensing hardware Using SIM as an underlying foundation the author's carefully structured presentation is designed to Formulate the challenges of sensor based motion planning and then build a theoretical foundation for sensor based motion planning strategies Investigate promising algorithmic strategies for mobile robots and robot arm manipulators in both cases addressing motion planning for the whole robot body Compare robot performance to human performance in sensor based motion planning to gain better insight into the challenges of SIM and help build synergistic human robot teams for tele operation tasks It is both exciting and encouraging to discover that robot performance decisively exceeds human performance in certain tasks requiring spatial reasoning even when compared to trained operators Review sensing hardware that is necessary to realize the SIM paradigm Some 200 illustrations graphic sketches and photos are included to clarify key issues develop and validate motion planning approaches and demonstrate full systems in operation As the first book fully devoted to robot motion planning in unstructured environments Sensing Intelligence Motion is a must read for engineers scientists and researchers involved in robotics It will help them migrate robots from highly specialized applications in factories to widespread use in society where autonomous robot motion is needed
