Whim, P.G. Johnson, 2012-12-06 Organic solvents represent a class of compounds whose utility is central to industrial and academic chemistry The impact of solvents in everyday products such as paints surface coatings adhesives pharmaceuticals and cleaning products is enormous and there is therefore much interest in their use This volume is divided into two parts Part 1 provides an authoritative review of the science and technology of solvents and related issues The topics covered are solvency and its measurement flammability health and toxicology environmental issues legislative information transport storage recovery and disposal and a review of solvent applications Part 2 provides reliable up to date data based on information provided by manufacturers and suppliers and is

presented as a database of over 350 solvent products subdivided by solvent group The data are also presented in key parameter tables covering boiling points melting points evaporation information vapor pressure flash points solubility parameters auto ignition temperatures and names and addresses of manufacturers with trade names In recent years there has been increased interest in health and safety environmental issues and aspects of the legislative control of chemicals including solvents and the choice of a given solvent has therefore become more complex The Directory of Solvents aims to provide in one place a broad spread of physico chemical data together with transport safety environmental and classification information provided by major European and U S suppliers and manufacturers of industrial organic solvents

*Thermodynamics of Solutions* Eli Ruckenstein, Ivan L. Shulgin, 2009-06-17 This book consists of a number of papers regarding the thermodynamics and structure of multicomponent systems that we have published during the last decade Even though they involve different topics and different systems they have something in common which can be considered as the signature of the present book First these papers are concerned with difficult or very nonideal systems i e systems with very strong interactions e g hydrogen bonding between components or systems with large differences in the partial molar volumes of the components e g the aqueous solutions of proteins or systems that are far from normal conditions e g critical or near critical mixtures Second the conventional thermodynamic methods are not sufficient for the accurate treatment of these mixtures Last but not least these systems are of interest for the pharmaceutical biomedical and related industries In order to meet the

thermodynamic challenges involved in these complex mixtures we employed a variety of traditional methods but also new methods such as the fluctuation theory of Kirkwood and Buff and ab initio quantum mechanical techniques The Kirkwood Buff KB theory is a rigorous formalism which is free of any of the approximations usually used in the thermodynamic treatment of multicomponent systems This theory appears to be very fruitful when applied to the above mentioned difficult systems
