

## Somatostatin and Somatostatin Receptors

- ▶ The action of somatostatin is mediated through membrane bound receptors (SSTR).
- ▶ 5 subtypes of SSTR have been recognized (SSTR1-5), with SSTR2 subclassified into SSTR2A and SSTR2B
- ▶ These G protein-coupled receptors (GPCRs) internalize after agonist activation.
- ▶ GPCR down-regulation and decreased mRNA and receptor protein synthesis can lead to development of resistance to treatment with somatostatin analogs.
- ▶ Somatostatin and its analogs induce G1 cell cycle arrest and induce apoptosis in NET cells. This property can be exploited for therapy.

## **Somatostatin And Its Receptors:**

*Somatostatin and Its Receptors* Derek J. Chadwick, Gail Cardew, 2008-04-30 This book describes a diverse analysis of the five somatostatin receptors somatostatin gene regulation somatostatin processing mechanisms of signal transduction and the design and use of somatostatin analogues including their possible clinical implications The book will provide a comprehensive summary of the cellular and molecular biology of somatostatin and its recently isolated receptors The book will review the design and use of specific somatostatin analogues both biochemically to characterize the specific functions of somatostatin and clinically in the treatment of various tumors The Receptors P. Michael Conn, 2014-05-10 The Receptors Volume II deals with receptors for somatostatin vitamin D insulin and animal viruses as well as for the 2 adrenergic and Ah systems The significance of translational modifications of receptor ligands is discussed along with the mechanisms of receptor ligand interactions The role of receptors in development and their regulation by tumors are also considered Comprised of 12 chapters this volume begins with a detailed account of the vitamin D receptor paying particular attention to its biochemical and physical properties as well as its mechanism of action The discussion then turns to experimental discrimination between alternative mechanistic models for the receptor mediated stimulation of adenylate cyclase the role of microaggregation in hormone receptor effector interactions and the biology and biochemistry of the Ah receptor Subsequent chapters explore the interactions of animal viruses with cell surface receptors insulin receptors determination of the size of neurotransmitter receptors by radiation inactivation target size analysis and protein glycosylation and receptor ligand interactions This book will be a valuable resource for students and practitioners in fields ranging from cell biology and biochemistry to physiology endocrinology and pharmacology *Peptide Receptors, Part I* A. Bjorklund, T. Hokfelt, P. Quinton, 2000-06-08 During the last few years the pace of research in the field of neuropeptide receptors has increased steadily new neuropeptides were discovered and the classification of receptor subtypes has been refined It thus appeared essential to update the information Peptide Receptors Part I summarizes current knowledge on ten distinct peptide families This volume integrates photomontages and maps of quantitative receptor autoradiography in situ hybridization histochemistry and immunocytochemistry images Application of these classical techniques and of new approaches such as transgenic and knock out animals has revealed a distinct species and tissue specific variation in receptor subtypes expression and pharmacology in the mammalian central nervous system The functional role of neuropeptides and their receptors in the CNS has been investigated thanks to the development of potent and selective receptor antagonists and agonists The development of specific neuropeptide related molecules will help to get a better understanding of receptor subtype physiology and neuronal distribution and may lead to innovative treatments in a variety of brain disorders *Cellular Peptide Hormone Synthesis and Secretory Pathways* Jens F. Rehfeld, Jens R. Bundgaard, 2010-03-10 The concept of hormonal regulation using intercellular peptide messengers dates back to the discovery of secretin in 1902 The concept was simple A

peptide is released from specific hormone producing cells endocrine cells into circulation upon stimulation of the cells The peptide hormone travels via blood to its target the cells of which are equipped with specific receptors for high affinity binding of the particular peptide hormone Receptor binding subsequently elicits action of the target cells This concept has been seriously challenged by modern biochemistry and cell biology Thus it is now well established that the gene of a specific peptide hormone may be expressed in different types of endocrine cells in neurons and in some instances also in adipocytes myocytes osteoblasts and immune cells Today only a few hormones including the old master hormone insulin represent the original endocrine paradigm Instead the widespread cellular synthesis now raises the question of how the body maintains the regulation of its functions by peptide hormones when a hormone may originate from a variety of cells      *Receptor*
