Fungal Diseases Institute of Medicine, Board on Global Health, Forum on Microbial Threats, 2011-10-08 Fungal diseases have contributed to death and disability in humans triggered global wildlife extinctions and population declines devastated agricultural crops and altered forest ecosystem dynamics Despite the extensive influence of fungi on health and economic well being the threats posed by emerging fungal pathogens to life on Earth are often underappreciated and poorly understood On December 14 and 15 2010 the IOM s Forum on Microbial Threats hosted a public workshop to explore the scientific and policy dimensions associated with the causes and consequences of emerging fungal diseases **Veterinary**

Social Biology of Microbial Communities Institute of Medicine, Board on Global Health, Forum on Microbial Threats, 2013-01-10 Beginning with the germ theory of disease in the 19th century and extending through most of the 20th century microbes were believed to live their lives as solitary unicellular disease causing organisms This perception stemmed from the focus of most investigators on organisms that could be grown in the laboratory as cellular monocultures often dispersed in liquid and under ambient conditions of temperature lighting and humidity Most such inquiries were designed to identify microbial pathogens by satisfying Koch s postulates 3 This pathogen centric approach to the study of microorganisms produced a metaphorical war against these microbial invaders waged with antibiotic therapies while simultaneously obscuring the dynamic relationships that exist among and between host organisms and their associated microorganisms only a tiny fraction of which act as pathogens Despite their obvious importance very little is actually known about the processes and factors that influence the assembly function and stability of microbial communities Gaining this knowledge will require a seismic shift away from the study of individual microbes in isolation to inquiries into the nature of diverse and often complex microbial communities the forces that shape them and their relationships with other communities and organisms including their multicellular hosts On March 6 and 7 2012 the Institute of Medicine s IOM s Forum on Microbial Threats hosted a public workshop to explore the emerging science of the social biology of microbial communities Workshop presentations and discussions embraced a wide spectrum of topics experimental systems and theoretical perspectives representative of the current multifaceted exploration of the microbial frontier Participants discussed ecological evolutionary and genetic factors contributing to the assembly function and stability of microbial communities how microbial communities adapt and respond to environmental stimuli theoretical and experimental approaches to advance this nascent field and potential applications of knowledge gained from the study of microbial communities for the improvement of human animal plant and ecosystem health and toward a deeper understanding of microbial diversity and evolution **The Social Biology of Microbial Communities**

Workshop Summary further explains the happenings of the workshop **Microbiology Australia** ,2006-03 *Microbial Evolution and Co-Adaptation* Institute of Medicine,Board on Global Health,Forum on Microbial Threats,2009-05-10 Dr Joshua Lederberg scientist Nobel laureate visionary thinker and friend of the Forum on Microbial Threats died on February 2 2008 It was in his honor that the Institute of Medicine s Forum on Microbial Threats convened a public workshop on May 20 21 2008 to examine Dr Lederberg s scientific and policy contributions to the marketplace of ideas in the life sciences medicine and public policy The resulting workshop summary *Microbial Evolution and Co Adaptation* demonstrates the extent to which conceptual and technological developments have within a few short years advanced our collective understanding of the microbiome microbial genetics microbial communities and microbe host environment interactions **Microbiology Australia** ,2006-03 **Microbiology Australia** ,2006-03 **Books in Print Supplement** ,2002 **Bacterial Exotoxins: How Bacteria Fight the Immune System** Inka Sastalla,Denise M. Monack,Katharina F. Kubatzky,2016-10-07 Bacterial pathogenicity factors are functionally diverse They may facilitate the adhesion and colonization of bacteria influence the host immune response assist spreading of the bacterium by e g evading recognition by immune cells or allow bacteria to dwell within protected niches inside the eukaryotic cell Exotoxins can be single polypeptides or heteromeric protein complexes that act on different parts of the cells At the cell surface they may insert into the membrane to cause damage bind to receptors to initiate their uptake or facilitate the interaction with other cell types For example bacterial superantigens specifically bind to major histocompatibility complex MHC II molecules on the surface of antigen presenting cells and the T cell receptor while cytolysins cause pore formation For intracellular activity exotoxins need to be translocated across the eukaryotic membrane Gram negative bacteria can directly inject effector proteins in a receptor independent manner by use of specialized needle apparatus such as bacterial type II III or type IV secretion systems Other methods of translocation include the phagocytic uptake of bacteria followed by toxin secretion or receptor mediated endocytosis which allows the targeting of distinct cell types Receptor based uptake is initiated by the binding of heteromeric toxin complexes to the cell surface and completed by the translocation of the effector proteins across the endosomal membrane In the cytosol toxins interact with specific eukaryotic target proteins to cause post translational modifications that often result in the manipulation of cellular signalling cascades and inflammatory responses It has become evident that the actions of some bacterial toxins may exceed their originally assumed cytotoxic function For example pore forming toxins do not only cause cytolysis but may also induce autophagy pyroptosis or activation of the MAPK pathways resulting in adjustment of the host immune response to infection and modification of inflammatory responses both locally and systemically Other recently elucidated examples of the immunomodulatory function of cell death inducing exotoxins include TcdB of *Clostridium difficile* which activates the inflammasome through modification of cellular Rho GTPases or the *Staphylococcus* d toxin which activates mast cells The goal of this research topic was to gather current knowledge on the interaction of bacterial exotoxins and effector proteins

with the host immune system The following 16 research and review articles in this special issue describe mechanisms of immune modification and evasion and provide an overview over the complexity of bacterial toxin interaction with different cells of the immune system

Body Horror and Shapeshifting: A Multidisciplinary Exploration Jessica Folio, Holly Luhning, 2019-01-04 This volume was first published by Inter Disciplinary Press in 2014 The body is unveiled not as a terra incognita but as terra to be rediscovered The authors whose diverse origins echo the multiple media used to convey their ideas establish a link between bodily metamorphosis and psychological fissures The body is a locus of paradoxes deformed infected monstrosized or negated but at the same time fascinating intimate or sensual Here readers will open the door of disruption They will explore the flesh or the inner processes of the body the idea of its degeneration even its perception as a gaping wound The authors in this volume question the very notion of identity as they embark on a journey to reflect on the self Life itself is a shapeshifting dance we unknowingly join in its myriad of colours and moves

Tick-Host-Pathogen Interactions Sarah Irène Bonnet, Ard Menzo Nijhof, Jose De La Fuente, 2018-08-24 Besides causing direct damage associated with blood feeding and in some cases through the excretion of toxins with their saliva the main relevance of ticks lies in the wide variety of pathogens that they can transmit including viruses bacteria protozoa and helminths Owing to socioeconomic and environmental changes tick distribution is changing with incursions of ticks and tick borne diseases occurring in different regions of the world when the widespread deployment of chemical acaricides and repellents has led to the selection of resistance in multiple populations of ticks New approaches that are environmentally sustainable and that provide broad protection against current and future tick borne pathogen TBP are thus urgently needed Such development however requires improved understanding of factors resulting in vector competence and tick host pathogen interactions This Research Topic provides an overview of known molecular tick host pathogen interactions for a number of TBPs and highlights how this knowledge can contribute to novel control and prevention strategies for tick borne diseases
