The Liverworts, Mosses and Ferns of Europe Wolfgang Frey, Jan-Peter Frahm, Eberhard Fischer, Lobin Wolfram, 2021-09-20 This entirely new English edition comprehensively revised and edited by T L Blockeel has been translated from German with some additional text by the authors In the past ten years there have been many advances in our knowledge of the taxonomy and distribution of European bryophytes and pteridophytes all of which have been taken into account in this the first English translation of *Die Moos und Farnpflanzen Europas* published in its sixth edition in 1995 as Volume 4 of the highly regarded *Kleine Kryptogamenflora* The structure of the book takes the form of an extended key to just under 2000 European species in which families and genera are keyed out mostly as single units The format is that of a field guide The systematic arrangement of the book largely follows the structure of the keys inherited from the previous edition and the sequence of the text with few exceptions follows that of the excellent published figures Consequently it has been considered unwise to introduce too many systematic innovations particularly as many systematic and phylogenetic questions remain to be answered At the same time every effort has been made to ensure comprehensive and up to date coverage of the species occurring in Europe Despite certain inherent difficulties the opportunity has been taken by the editor to modify sections of the text correct errors and iron out ambiguities and inconsistencies As in the last German edition some rare and newly added species are not keyed out independently but are treated briefly by means of a clearly indicated annotation in the body of the key The book is unique in its coverage of all bryophytes and ferns to found within this large and varied geographical area its scope extending from Iceland in the west to the Ural Mountains in the east and including the northern Macaronesian islands The fern section has been further extended to include Georgia and the Caucasus Turkey and Cyprus and the Cape Verde Islands The distribution reflects current national boundaries Although the bryophyte and fern sections of the book vary slightly in their presentation reflecting their separate authorship every effort has been made to standardize them where practicable The literature references combining those to bryophytes and ferns have also been brought right up to date and the Glossary contains many additional entries Publications dealing with rare and threatened species are highlighted In a single volume this work provides users with the means of making at least a preliminary identification of any bryophyte or fern which they might encounter in Europe or Macaronesia

The Birds of Northern Melanesia Ernst Mayr, Jared M. Diamond, 2001 Speciation is the process by which co existing daughter species evolve from one ancestral species e g humans chimpanzees and gorillas arising from a common

ancestor around 5 000 000 years ago However many questions about speciation remain controversial The Birds of Northern Melanesia provides by far the most comprehensive study yet available of a rich fauna composed of the 195 breeding land and fresh water bird species of the Bismarck and Solomon Archipelagoes east of New Guinea This avifauna offers decisive advantages for understanding speciation and includes famous examples of geographic variation discussed in textbooks of evolutionary biology The book results from 30 years of collaboration between the evolutionary biologist Ernst Mayr and the ecologist Jared Diamond It shows how Northern Melanesian bird distributions provide snapshots of all stages in speciation from the earliest widely distributed species without geographic variation to the last closely related reproductively isolated species occurring sympatrically and segregating ecologically The presentation emphasizes the wide diversity of speciation outcomes steering a middle course between one model fits all simplification and ungeneralizable species accounts Questions illuminated include why some species are much more prone to speciate than others why some water barriers are much more effective at promoting speciation than others and whether hypothesized taxon cycles faunal dominance and legacies of Pleistocene land bridges are real These years of study have resulted in a huge database complete with distributions of all 195 species on 76 islands together with their taxonomy colonization routes ecological attributes abundance and overwater dispersal Color plates depict 88 species and allospecies many of which have never been seen before For students of speciation Northern Melanesian birds now constitute a model system against which other biotas can be compared For population biologists interested in other problems besides speciation this rich database can now be mined for insights
