

Lesson 6 Nervous System

Science Snapshot

Main Idea:

The brain, spinal cord, bundle of nerve fibers (nerve), and nerves (optical/nervous system) make up your nervous system. One nerve cell is called a neuron.

Key Concepts

- The **brain**, **spinal cord**, and **nerves** are three major parts of your nervous system.
- Your **Cerebrospinal fluid** (CSF) cushions your brain and spinal cord.
- The brain is made up of 4 main parts: The **Cerebrum**, **Cerebellum**, and **Corpus Callosum**, and **brain stem**.
- A nerve cell is called a **neuron**. A neuron has two parts: **dendrite** and **cell body** (or **soma**).

What do you remember?

1. Name the three major parts of the nervous system.
2. Describe the function of the cerebrospinal fluid.
3. Name the four main parts of the brain.
4. Name the two parts of a neuron.

“Wow” fact:

Paul,2024-06-21 From the eighteenth century until as recently as World War II the natural scientist was depicted as a kind of moral superhero objective modest ascetic and selflessly dedicated to the betterment of humanity What accounts for the widespread diffusion of this myth In *Science and Immortality* Charles B Paul provides a partial explanation The modern ideology of the scientist as disinterested seeker after truth arose partly through the transformation of an ancient literary form the commemoration of heroes In 1699 Bernard de

Fontenelle as Secretary of the Paris Academy of Sciences inaugurated the tradition of the loge or eulogy in honor of members of the Academy. The moral qualities that had once been attributed to the idealized Stoic philosopher were transferred in the eulogies to the natural philosopher or scientist. The over two hundred loges composed between 1699 and 1791 by Fontenelle and his successors Mairan, Fouchy, and Condorcet served as a powerful device for the popularization of science. It was the intention of the secretaries though not only to exhibit the natural scientist as a modern day hero but also to present a truthful record of scientific activity in France. Paul examines the loges both as a literary form that used rhetorical and stylistic devices to reconcile these two conflicting goals and as a collective biography of a new breed of savants, one that already contained the seed of the conflict between self image and reality embedded in the modern scientific enterprise. A unique history of science in eighteenth century France. Science and Immortality illuminates the record in the loges of the professionalization of some sciences and the maturation of others, the recognition of their utility to society and the state, and the widening trust in science as the remedy to economic restriction and political absolutism. Paul's thorough catalog of the loges, extensive bibliography, and translations of representative loges make this book an essential source for scholars in the field. This title is part of UC Press's Voices Revived program, which commemorates University of California Press's mission to seek out and cultivate the brightest minds and give them voice, reach, and impact. Drawing on a backlist dating to 1893, Voices Revived makes high quality peer reviewed scholarship accessible once again using print on demand technology. This title was originally published in 1980.

Science, Music, And Mathematics: The Deepest Connections (Second Edition) Michael Edgeworth McIntyre, 2023-08-02 Professor Michael Edgeworth McIntyre is an eminent scientist who has also had a part time career as a musician. In this book he offers an extraordinary synthesis revealing the many deep connections between science, music, and mathematics. He avoids equations and technical jargon. The connections are deep in the sense of being embedded in our very nature, rooted in biological evolution over hundreds of millions of years. Michael guides us through biological evolution, perception, psychology, and even unconscious science and mathematics all the way to the scientific uncertainties about the climate crisis. He also has a message of hope for the future. Contrary to popular belief, he holds that biological evolution has given us not only the nastiest but also the most compassionate and cooperative parts of human nature. This insight comes from recognizing that biological evolution is far more than a simple competition between selfish genes. Instead, he argues, in some ways it is more like the turbulent eddying flow in a river or in an atmospheric jet stream, a complex process spanning a vast range of timescales. Professor McIntyre is a Fellow of the Royal Society of London (FRS) and has long been interested in how different branches of science can better communicate with each other and with the public. His work harnesses aspects of neuroscience and psychology that point toward the deep, lucid principles that underlie skilful communication principles related to the way music works, music of any genre. This Second Edition sharpens the previous discussion of communication skills and their importance for today's great problems ranging from the widely discussed

climate crisis to the need to understand the strengths and weaknesses of artificial intelligence **Popular Science**
