The Transient Radio Sky Evan Francis Keane, 2011-07-16 The high time resolution radio sky represents unexplored astronomical territory This thesis presents a study of the transient radio sky focussing on millisecond scales As such the work is concerned primarily with neutron stars In particular this research concentrates on a recently identified group of neutron stars known as RRATs which exhibit radio bursts every few minutes to every few hours After analysing neutron star birthrates a re analysis of the Parkes Multibeam Pulsar Survey is described which has resulted in the discovery of 19 new transient radio sources Of these 12 have been seen to repeat and a follow up campaign of observations has been undertaken These studies have greatly increased our knowledge of the rotational properties of RRATs and enable us to conclude that they are pulsars with extreme nulling and or pulse to pulse modulation Although the evolution of neutron stars post supernova is not yet understood it seems that RRATs fit into the emerging picture in which pulsar magnetospheres switch between stable configurations **Monthly Catalog of United States Government Publications** , **High Speed Photometer Instrument Handbook** Robert C.
