Therapeutic potential of natural products in oxidative and metabolic diseases Ochuko Lucky Erukainure, Aliyu Muhammad, Erukainure, Aliyu Muhammad, Chika Ifeanyi Chukwuma, Md Shahidul Islam, Olakunle Sanni, Veronica Folakemi Salau, 2024-04-26 Oxidative and metabolic diseases represent a large proportion of global challenges to health and quality of life These diseases are often characterised by the imbalance between the cellular prooxidant products of metabolic processes and the antioxidant molecules within the cells The imbalance often led to the underlying factors that exacerbate the pathogenesis of some life threatening diseases such as carcinogenesis

obesity diabetes and cardiovascular diseases Natural products including phytochemicals and functional foods are known for their ability to affect metabolic processes such as ameliorating reactive oxygen species induced mitochondria dysfunction mitigating inflammatory response and other cellular functions that could ameliorate the disease developments Despite the relatively low toxicities of natural products as compared with synthetic products further studies are still required to optimize the bioavailability therapeutics pharmaceuticals and clinical trials of natural products in patients suffering oxidative and metabolic diseases

New Mechanisms for Anti-Cancer Drugs Ayaz Shahid,2024-04-15 Cancer is the second leading cause of death Every year many anticancer drug candidates are discovered and synthesized but the major challenge lies in identifying characterizing and evaluating their efficacy The aim of this Research Topic New Mechanisms for Anti Cancer Drugs is to collect a group of publications focused on novel chemical compounds exhibiting new modes of actions and or new target proteins to fulfill their cytotoxic activity on cancer cells In this context we will also be pleased to consider studies on drug repurposing including approved discontinued and shelved drugs when anti cancer activity results from an unexpected mode of action

Calorie Restriction, Aging and Longevity Arthur V. Everitt,Suresh I. S. Rattan,David G. Couteur,Rafael de Cabo,2010-06-14 Food or calorie restriction has been shown in many short lived animals and the rhesus monkey to prolong life span Life long nutrition studies are not possible in humans because of their long survival Studies over two to six years in healthy adult humans have however shown that a 20% reduction in food or calorie intake slows many indices of normal and disease related aging Thus it is widely believed that long term reduction in calorie or food intake will delay the onset of age related diseases such as heart disease diabetes and cancer and so prolong life Over the last 20 or more years there has been a progressive rise in food intake in many countries of the world accompanied by a rising incidence of obesity Thus our increasing food and calorie intake has been linked to the rising incidence of cardiovascular disease and diabetes in early adult life It is accepted that overeating accompanied by reduced physical exercise will lead to more age related diseases and shortening of life span The answer is to reduce our calorie intake improve our diet and exercise more But calorie restriction is extremely difficult to maintain for long periods How then can we solve this problem Edited by a team of highly distinguished academics this book provides the latest information on the beneficial effects of calorie restriction on health and life span This book brings us closer to an understanding at the molecular cellular and whole organism level of the way forward

Type 2 Diabetes Robert Fried, Richard M. Carlton, 2018-10-25 Approximately 29 million Americans are diagnosed with Type 2 diabetes annually Of that number only about 36 percent 10 44 million diabetes sufferers achieve satisfactory medical outcomes and would need additional help rarely available to reliably control their glucose levels Contrary to popular belief although anti diabetic medications can lower sugar levels nevertheless they have a poor performance track record because inflammation in the blood vessels persists This book details recent scientific findings that cardiovascular kidney vision peripheral nervous system and other body damage caused by chronic high levels of blood sugar hyperglycemia in Type 2 diabetes is actually due to excessive generation of unopposed free radicals and reactive oxygen species ROS These in turn cause chronic systemic inflammation and dysfunction of the endothelial lining of the arterial blood vessels jeopardizing the formation of the protective molecule nitric oxide NO thus severely impairing the blood supply to every organ and tissue in the body This book also catalogues the evidence that chronic hyperglycemia causes profound and often irreversible damage even long before Type 2 diabetes has been diagnosed In addition because conventional prescription treatments are unfortunately often inadequate the book details evidence based complementary means of blood sugar control

Neurodegeneration: From Genetics to Molecules Victoria Campos-Peña, Marco Antonio Meraz-Ríos, Rosalinda Guevara-Guzmán, Karla Guadalupe Carvajal, 2016-11-15 Chronic degenerative diseases are one of the major public health problems particularly those affecting the nervous system They are characterized by the degeneration of specific cell populations that include several pathologies which contribute significantly to morbidity and mortality in the elderly population Therefore in recent years the study of neuroscience has gained significant importance Most of these neurodegenerative disorders are the result of a complex interaction between genetic and environmental factors that generate progression and can even determine its severity The presence of mutations in genes as LRRK2 SNCA PARK7 PARK2 or PINK1 is associated with Parkinson s disease Mutations in genes such as APP PS1 and PS2 are associated with familial Alzheimer s disease while HTT gene mutations are the cause of Huntington s disease In most cases this condition is inherited in an autosomal dominant pattern which means one copy of the altered gene in each cell is sufficient to cause the disorder It is known that these mutations can also alter the proteins function however it has not yet been possible to fully understand how some genetic changes cause the disease or influence the risk of developing these disorders Most symptoms seen in these conditions occurs when specific nerve cells are damaged or die generating a loss in brain communication Also many of these mutations generate aggregation of intracellular or extracellular proteins affecting cell function and eventually causing neuronal death It is unclear whether the presence of these aggregates play an important role in nerve cell death during the development of neurodegenerative diseases or if they are simply part of the response of cells to the disease Other mutations affect the mitochondrial function generating alterations in energy production and promoting the formation of unstable molecules such as free radicals Under normal conditions the harmful effects caused by free radicals are offset within the cell However in pathological conditions the presence of mutations can alter this process by allowing the

accumulation of radicals and damaging or killing cells On the other hand we also know that these diseases may not have a direct genetic component thus the study of sporadic type neurodegenerative diseases is much more complex Histopathological lesions as well as the cellular and molecular alterations are generally indistinguishable from familial cases For this reason it is important to understand the genetic and molecular mechanisms associated with this type of pathologies In this sense this issue aims to understand the molecular processes that occur in the brain and how these are influenced by the environment genetics and behavior
