G. Jhingran,Roger S. V. Pullin,1985 **Channel Catfish Farming Handbook** C. S. Tucker,2013-11-11 Although catfish have been farmed for about 30 years and catfish farming is the most successful aquacultural enterprise in the United States there are those who contend that catfish farming is still as much of an art as it is a science This position is difficult to refute completely particularly considering that some practices used in catfish farming appear to have little scientific basis Skill

coupled with a small dose of mysticism certainly plays a role in the culture of catfish and the catfish producer is faced with the unenviable task of rearing an animal in an environment that requires considerable management. Certain aspects may still be an art because research and technical information needed to support the industry have lagged behind industry growth; however, the basic principles underlying catfish farming are based on sound scientific evidence whose foundation was laid in the 1950s by work conducted at state and federal fish hatcheries in the southeastern and midwestern United States. Since that time, several university and government laboratories have expanded the scientific base for catfish farming. As a result, considerable information is available, but it is generally fragmented and exists in a multitude of diverse scientific and trade journals. The material is often too technical or abstract to be comprehensible to fish culturists and personnel in allied industries. This book fits the definition of the term handbook in the sense that it is intended as a book of instruction or guidance as well as a reference.

Reviews: Methods and Technology in Fish Biology and Fisheries published by Kluwer Academic Publishers is a book series dedicated to the publication of information on advanced, forward-looking methodologies, technologies, or perspectives in fish and fisheries. This series is especially dedicated to relevant topics addressing global international concern in fish and fisheries. Humans continue to challenge our environments with new technologies and technological applications. The dynamic creativity of our own species often tends to place the greatest burden on our supporting ecosystems. This is especially true for aquatic networks of creeks, lakes, rivers, and ocean environments. We also frequently use our conceptual powers to balance conflicting requirements and demands on nature and continue to develop new approaches and tools to provide sustainable resources as well as conserve what we hold most dear on local and global scales. This book series will provide a window into the developing dynamic among humans, aquatic ecosystems, both freshwater and marine, and the organisms that inhabit aquatic environments. There are many reasons to doubt the increasing social and economic value technology has gained over the last two centuries. Science and technology represent stages in human development. I agree with Ernst Mayer when he said in *Toward a New Philosophy of Biology* (1988) that endeavors to solve all scientific problems by pure logic and refined measurements are unproductive if not totally irrelevant.
