Symmetries and Semi-invariants in the Analysis of Nonlinear Systems Laura Menini, Antonio Tornambè, 2011-05-06 This book details the analysis of continuous and discrete time dynamical systems described by differential and difference equations respectively Differential geometry provides the tools for this such as first integrals or orbital symmetries together with normal forms of

vector fields and of maps A crucial point of the analysis is linearization by state immersion The theory is developed for general nonlinear systems and specialized for the class of Hamiltonian systems By using the strong geometric structure of Hamiltonian systems the results proposed are stated in a different less complex and more easily comprehensible manner They are applied to physically motivated systems to demonstrate how much insight into known properties is gained using these techniques Various control systems applications of the techniques are characterized including computation of the flow of nonlinear systems computation of semi invariants computation of Lyapunov functions for stability analysis and observer design

Rice, 2009-09-09 The *Advances in Chemical Physics* series provides the chemical physics and physical chemistry fields with a forum for critical authoritative evaluations of advances in every area of the discipline Filled with cutting edge research reported in a cohesive manner not found elsewhere in the literature each volume of the *Advances in Chemical Physics* series serves as the perfect supplement to any advanced graduate class devoted to the study of chemical physics *Handbook of Dynamical Systems* B. Fiedler, 2002-02-21 This handbook is volume II in a series collecting mathematical state of the art surveys in the field of dynamical systems Much of this field has developed from interactions with other areas of science and this volume shows how concepts of dynamical systems further the understanding of mathematical issues that arise in applications Although modeling issues are addressed the central theme is the mathematically rigorous investigation of the

resulting differential equations and their dynamic behavior. However, the authors and editors have made an effort to ensure readability on a non-technical level for mathematicians from other fields and for other scientists and engineers. The eighteen surveys collected here do not aspire to encyclopedic completeness but present selected paradigms. The surveys are grouped into those emphasizing finite dimensional methods, numerics, topological methods, and partial differential equations. Application areas include the dynamics of neural networks, fluid flows, nonlinear optics, and many others. While the survey articles can be read independently, they deeply share recurrent themes from dynamical systems: Attractors, bifurcations, center manifolds, dimension reduction, ergodicity, homoclinicity, hyperbolicity, invariant and inertial manifolds, normal forms, recurrence, shift dynamics, stability, to name just a few, are ubiquitous dynamical concepts throughout the articles. *Energy Research Abstracts*, 1988
