Quantum Chemistry of Solids Robert A. Evarestov, 2013-01-19. Quantum Chemistry of Solids delivers a comprehensive account of the main features and possibilities of LCAO methods for the first principles calculations of electronic structure of periodic systems. The first part describes the basic theory underlying the LCAO methods applied to periodic systems and the use of Hartree-Fock, HF, Density Function theory, DFT, and hybrid Hamiltonians. The translation and site symmetry consideration is included to establish connection between k space solid state physics and real space quantum chemistry. The inclusion of electron correlation effects for periodic systems is considered on the basis of localized crystalline orbitals. The possibilities of LCAO methods for chemical bonding analysis in periodic systems are discussed. The second part deals with the applications of LCAO methods for calculations of bulk crystal properties including magnetic ordering and crystal structure optimization. In the second edition, two new chapters are added in the application part II of the book. Chapter 12 deals with the recent LCAO calculations and illustrates the efficiency of the scalar relativistic LCAO method for solids containing heavy atoms. Chapter 13 deals with the symmetry properties and the recent applications of LCAO method to inorganic nanotubes. New material is added to chapter 9 devoted to LCAO calculations of perfect crystal properties. The possibilities of LCAO method for calculation of the high frequency dielectric constants of crystals and the description of phase transitions in solids are discussed. The efficiency of LCAO method in the quantum mechanics molecular dynamics approach to the interpretation of x-ray absorption and EXAFS spectra is illustrated. A new section is devoted to recent LCAO calculations of electronic, vibrational, and magnetic properties of tungstates MeWO_4 (Me: Fe, Co, Ni, Cu, Zn, Cd).

Optical Characterization of Solids D. Dragoman, M. Dragoman, 2013-04-17 The interaction between the electromagnetic field and matter is an essential issue in modern physics. The physical concepts describing the field-matter interaction are of paramount importance being at the origin of quantum mechanics and quantum field theories. On the other hand, the field-matter interaction is the main tool used nowadays to investigate the structure and properties of matter at the microscopic level. The subject of this book is the characterization of the solid state through the interaction with the electromagnetic field. The main properties of different types of solids such as dielectrics, semiconductors, disordered materials, impurified solids, low-dimensional structures, nanostructures, metals or superconductors are revealed through their interaction with the electromagnetic field whose wavelength lies within the optical spectrum. Therefore, the book is focused on the investigation of the main properties of different types of solids that are obtained through light emission, absorption or scattering. There is already an immense literature dedicated to light-solid state interactions or in other words, the optical spectroscopy of solids due to its major role in understanding the physics and properties of the solid state. This literature is continuously growing and flourishing due also to the paramount importance of solid-state devices in the development of any conceivable area of technology including the booming information technology. However, this literature is mainly written emphasizing a certain type of materials, semiconductors, high-temperature superconductors etc. or a certain type of optical spectroscopy method, Raman scattering, luminescence etc.

Electronic Properties of Crystalline Solids Richard Bube, 2012-12-02 *Electronic Properties of Crystalline Solids: An Introduction to Fundamentals* discusses courses in the electronic properties of solids taught in the Department of Materials Science and Engineering at Stanford University. The book starts with a brief review of classical wave mechanics discussing the concept of waves and their role in the interactions of electrons, phonons and photons. The book covers the free electron model for metals and the origin, derivation and properties of allowed and forbidden energy bands for electrons in crystalline materials. It also examines transport phenomena and optical effects in crystalline materials including electrical conductivity, scattering phenomena, thermal conductivity, Hall and thermoelectric effects, magnetoresistance, optical absorption, photoconductivity and other photoelectronic effects in both ideal

and real materials This book is intended for upper level undergraduates in a science major or for first or second year graduate students with an interest in the scientific basis for our understanding of properties of materials
