Introduction

The lithostratigraphy of the Upper Cambrian succession in southern Alberta has been the subject of several reports by J. D. Aitken, R. G. Greggs, and D. C. Pugh. The development of the biostratigraphic framework for these rocks, however, has received much less attention. Aside from the unpublished thesis study of Greggs (1962), biostratigraphic work has been restricted to brief reports on the conodont and trilobite faunas of a short section across the Cambrian-Ordovician boundary at Mount Wilson, Banff National Park (Derby and others, 1972) and on trilobite faunas near the Mistaya-Survey Peak contact at Wilcox Pass (Dean, 1978). Here, we present occurrence data of trilobites and conodonts for a 345-m measured section through the Franconian and Lower Tremadocian interval at Wilcox Peak, Jasper National Park. The studied section starts at a point 1.5 km northwest of the Columbia Icefields Chalet, and extends along the ridge leading towards Wilcox Peak (see Dean, 1978, fig. 2).

Lithostratigraphy

The interval considered here includes the uppermost Lyell, Bison Creek, Mistaya, and lower Survey Peak Formations. A sharp break in slope marks the boundary between the cliff-forming Lyell carbonates and the recessive shales, mudstones, and limestones of the Bison Creek. The boundary between the Bison Creek and the Mistaya is gradational, and is arbitrarily placed at the level where the carbonates become cliff-forming. The appearance of recessive shales and limestones of the Survey Peak Formation above the resistant Mistaya carbonates also results in a marked break in slope.

Our trilobite and conodont biostratigraphy confirm Dean's (1978, p. 4) conclusion that the Mistaya-Survey Peak contact is somewhat younger at Wilcox Peak than at Mount Wilson, about 40 km to the southeast.

Trilobite Biostratigraphy

This investigation of the Upper Cambrian and Lower Ordovician trilobite biostratigraphy in Banff and Jasper National Parks has been initiated as part of a project on the systematics, phylogeny, and paleobiogeography of the trilobites of the Ptychaspid Biomere.

Knell,2012-11-06 Stephen Jay Gould borrowed from Winston Churchill when he described the conodont animal as a riddle wrapped in a mystery inside an enigma This animal confounded science for more than a century Some thought it a slug others a fish a worm a plant even a primitive ancestor of ourselves The list of possibilities grew and yet an answer to the riddle never seemed any nearer Would the animal that left behind these minuscule fossils known as conodonts ever be identified Three times the animal was found but each was quite a different animal Were any of them really the one Simon J Knell takes the reader on a journey through 150 years of scientific thinking imagining and arguing Slowly the animal begins to reveal traces of itself its lifestyle its remarkable evolution its witnessing of great catastrophes its movements over the surface of the planet and finally its anatomy Today the conodont animal remains perhaps the most disputed creature in the zoological world
