The Mathematical Approach To Physiological Problems A Critical Primer:

The Mathematical Approach to Physiological Problems Douglas Shepard Riggs, 1963 With its formulations derived entirely from algebra and introductory calculus this primer takes as its central purpose the encouragement of high standards of mathematical conduct And yet the author is not so interested in fostering a formal elegance or abstract rigor as in imparting to the student a care for the definition of the problem the choice of units the avoidance of ambiguities and inner contradictions and as in instilling in him a feeling for dimensionality an awareness of the pitfalls of various techniques an appreciation for the habitual checking of derivations through numerical substitution Riggs adduces a number of examples from the open literature in which biologists of the highest standards of experimental exactness are shown presenting their careful data in mathematically inexact form As the mathematization of the biological sciences proceeds and accelerates it becomes even more important that definitions and derivations be as closely scrutinized as tissue sections and radiation counters In most cases the various chapters develop their material in a general mathematical form with applications to particular biological problems developed in thought provoking exercises Many of these are based on published papers and the student is asked to find mistaken assumptions and procedures A lengthy appendix presents and where necessary explains step by step the derivation of the solutions Other appendices concern approximations the use of logarithms and units and symbols The text includes treatment of the following topics Definitions assumptions and models Symbols dimensions and units Aids to mathematical work analog and digital computers graphical methods the method of least squares linear transformations Constants variables and functional relationships correlations symbol and arrow diagrams Feedback relationships feedback loops positive and negative feedback homeostasis Exponential growth and disappearance Transfer of substances between biological compartments steady states and equilibrium states simple diffusion general kinetics membrane permeability Further kinetic problems fluid flow metabolic transformations various biological examples The law of mass action effects of volume and temperature collision theory chemical equilibria ionization Substrate enzyme and drug receptor interactions The derivation of equations a general method The derivation of equations a detailed example anesthetic gases Methods for checking the validity of equations

A Critical Primer, 1970* The Mathematical Approach to Physiological Problems Douglas Shepard Riggs, 1970 **Mathematical Problems in Biology** P. van den Driessche, 2013-03-08

A conference on Some Mathematical Problems in Biology was held at the University of Victoria Victoria B C Canada from May 7 10 1973 The participants and invited speakers were mathematicians interested in problems of a biological nature and scientists actively engaged in developing mathematical models in biological fields One aim of the conference was to attempt to assess what the recent rapid growth of mathematical interaction with the biosciences has accomplished and may accomplish in the near future The conference also aimed to expose the problems of communication between mathematicians and biological scientists and in doing so to stimulate the interchange of ideas It was recognised that

the topic spans an enormous breadth and little attempt was made to balance the very diverse areas Widespread active interest was shown in the conference and just over one hundred people registered The varied departments and institutions across North America from which the participants came made it both academically and geographically mixed The chief activity of the conference was the presentation of papers Nine invited guest speakers see table of contents each gave a one hour talk These covered a wide range of topics There were twenty five shorter twenty minute contributed papers and almost all papers were followed by a five minute question and discussion period Duplicated abstracts of presented papers were available at the meeting An evening informal discussion meeting of participants chaired by Dr A B Tayler and led by Drs E M Hagmeier E C

Introduction to Mathematics for Life Scientists Edward Batschelet, 2012-12-06 From the reviews Here we have a book which we can wholeheartedly suggest The mathematics is sound and pared to essentials the examples are an impressive well chosen selection from the biomathematics literature and the problem sets provide both useful exercises and some fine introductions to the art of modeling Batschelet has written an introduction to biomathematics which is notable for its clarity not only a clarity of presentation but also a clarity of purpose backed by a sure grasp of the field Bulletin of Mathematical Biology 1 For research workers in the biomedical field who feel a need for freshening up their knowledge in mathematics but so far have always been frustrated by either too formal or too boring textbooks there is now exactly what they would like to have an easy to read introduction This book is highly motivating for practical workers because only those mathematical techniques are offered for which there is an application in the life sciences The reader will find it stimulating that each tool described is immediately exemplified by problems from latest publications Int Zeitschrift f r klinische Pharmakologie Therapie und Toxikologie 2
