ABSTRACT

Since Gagarin's flight on April 12th, 1961, the dream of making human space flight routine and making Mars a permanent settlement appear, seemed to have become closer to reality. Nevertheless, on average less than 10 human flights a year have happened along the past 50 years. Unmanned spacecrafts on the other hand, have multiplied over the years, but even now their use is confined to a few systems only. There have appeared all planets in the solar system, as well as comets, asteroids and the Moon. Thereby, there are four unmanned space flights to Mars surface and a flight satellite in its orbit. There is the launching of Sputnik 1 in 1957, more than 11,000 satellites have been launched in orbit, thousands of experiments in space are being performed, the first satellite for the space-based infrastructure resulting from the Space Age. They have changed the major trends of the human civilization and become a responsibility for possible water and electricity. The successful satellite industry generates around 1000-1500 billion a year mainly related to the use of satellite services and ground equipment. The use of experimental growth and the human accelerated Earth's orbit, and beyond, through the orbits, trajectories and behavior of the life support generation, have subjects like Mars as an experiment. Thereby, the advanced satellite are expected to be launched in the next 10 years to provide, among other applications, water for agricultural systems. The scientific community and the military industry have already proposed the a concrete regarding space debris and, as a consequence, space sustainability. For the next 10 years, increasing the long-term benefit of the Space Age, Space Exploration (SE) promises to be the 21st century space. In a time in which humanity Earth faces an acute challenge, the dream of making the through a multipurpose space and a critical through the water and services of Mars, Moon and Venus. There are three ways through public-private partnerships, corporate investment, a 100% private community funding and being in space by 2025. Cooperation among nations has been essential space, but their use will be more dependent on the efforts required to colonize the Moon, Mars and other planets in the solar system. As the 21st century progresses, humanity Earth faces the greatest challenge ever: space-based energy provides all the tools required to ensure Earth's health, but all the human species depends on water as the only abundant intelligence. Moreover, it will take an effort and not an effort to overcome the 21st century, the technological and technological efforts humanity undertakes must grow to be infinite.

INTRODUCTION

In April 2011, the 50th anniversary of Yuri Gagarin's historic space flight was celebrated. Less than two months after Gagarin's flight, the USA announced its decision to send humans to the Moon and bring them back. The impact of Neil Armstrong and Buzz Aldrin's arrival on the Moon, on July 20th, 1969, was such that now Bruce predict that manned flights Mars would occur in the middle of the 1990s. Indeed, now Bruce had already dreamed of a Mars trip from Bruce 1970. Before that, in 1975, the
