Wilkinson (1963) provided data relevant to the Yerkes-Dodson hypothesis looking at the effects of noise and sleep deprivation. The numbers in the cells of the table illustrate increasing levels of arousal. So the condition of lowest arousal (1 in the table) would be being sleep deprived and carrying out an experiment without any noise. Whereas the highest level (4) would be people who'd had normal sleep and who had experienced noise.

The task was a continuous reaction time task and accuracy of performance was monitored.

	Quiet (low)	Noise (higher)
Sleep deprived (low)	1	2
Normal sleep (higher)	3	4

**The Neuroimmunological Basis of Behavior and Mental Disorders** Allan Siegel,Steven S. Zalcman,2008-11-09 For many years the immune and central nervous systems were

thought to function independently with little or no interaction between the two. This view has undergone dramatic changes over the past three decades. Indeed, we now know that there exist various feedback loops between the brain and immune systems that impact significantly upon different behavioral processes including normal behavior and mental disorders. Pioneering efforts in generating this change were initiated by a number of early investigators. Included were those whose efforts were directed at establishing neuroimmune connections as well as others whose research focused upon the relationship between immunity, cytokines, and behavior. This book brings together outstanding scientists and clinicians who have made major contributions to the rapidly developing field of investigating the relationship between immunity and behavior. The book is divided into three parts. The first part describes pathways by which the brain and immune systems communicate and interact with each other. In the chapter "Cytokines and the Blood-Brain Barrier," it provides insight into interactions between the blood-brain barrier and cytokines. Such interactions underlie basic communication between the immune system and brain that are present in normal as well as in disease conditions. In the chapter "Neurochemical and Endocrine Responses to Immune Activation: The Role of Cytokines," the neurochemical and endocrine consequences of immune challenge and cytokine administration on central neurotransmitter activity are discussed.
