Cartographies of Danger Mark Monmonier, 2008-04-15 No place is perfectly safe but some places are more dangerous than others Whether we live on a floodplain or in Tornado Alley near a nuclear facility or in a neighborhood poorly lit at night we all co exist uneasily with natural and man made hazards As Mark Monmonier shows in this entertaining and immensely informative book maps can tell us a lot about where we can anticipate certain hazards but they can also be dangerously misleading California for example takes earthquakes seriously with a comprehensive program of seismic mapping whereas Washington has been comparatively lax about earthquakes in Puget Sound But as the Northridge earthquake in January 1994 demonstrated all too clearly to Californians even reliable seismic hazard maps can deceive anyone who misinterprets known fault lines as the only places vulnerable to earthquakes Important as it is to predict and prepare for catastrophic natural hazards more subtle and persistent phenomena such as pollution and crime also pose serious dangers that we have to cope with on a daily basis Hazard zone maps highlight these more insidious hazards and raise awareness about them among planners local officials and the public With the help of many maps illustrating examples from all corners of the United States Monmonier demonstrates how hazard mapping reflects not just scientific understanding of hazards but also perceptions of risk and how risk can be reduced Whether you live on a faultline or a coastline near a toxic waste dump or an EMF generating power line you ignore this book s plain language advice on geographic hazards and how to avoid them at your own peril *Earthquake Information Bulletin* ,1989 **Earthquakes** Phyllis R. Marcuccio, 1999-07 A curriculum on

earthquake for teachers to use with elementary school children The material offers science content processes that are designed with children's abilities and needs in mind Earthquakes are a danger to the entire nation not just a few states a fundamental concern throughout the development of this curriculum The writing team included teachers scientists curriculum specialists and consultants from 6 states with a wide range of educational experience Teacher in 11 states tested the material and provided feedback Includes dozens of line masters with maps and drawings for use in the classroom

*Geological Survey of Canada, Open File 2929*,      **Natural Disasters** David C. Alexander, 1993-07-29  
As a well balanced and fully illustrated introductory text this book provides a comprehensive overview of the physical technological and social components of natural disaster The main disaster producing agents are reviewed systematically in terms of geophysical processes and effects monitoring mitigation and warning The relationship between disasters and society is examined with respect to a wide variety of themes including damage assessment and prevention hazard mapping emergency preparedness the provision of shelter and the nature of reconstruction Medical emergencies and the epidemiology of disasters are described and refugee management and aid to the Third World are discussed A chapter is devoted to the sociology psychology economics and history of disasters In many parts of the world the toll of death injury damage and deprivation caused by natural disasters is becoming increasingly serious Major earthquakes volcanic eruptions droughts floods and other similar catastrophes are often followed by large relief operations characterized by substantial involvement of the international community The years 1990 2000 have therefore been designated by the United Nations as the International Decade for Natural Disaster Reduction The book goes beyond mere description and elevates the field of natural catastrophes to a serious academic level The author's insights and perspectives are also informed by his practical experience of being a disaster victim and survivor and hence the unique perspective of a participant observer Only by surmounting the boundaries between disciplines can natural catastrophe be understood and mitigation efforts made effective Thus this book is perhaps the first completely interdisciplinary fully comprehensive survey of natural hazards and disasters It has a clear theoretical basis and it recognizes the importance of six fundamental approaches to the field which it blends carefully in the text in order to avoid the partiality of previous works It covers the earth and social sciences as well as engineering architecture and development studies This breadth is made possible by virtue of a strong emphasis on simple

principles of the interaction of geophysical agents with human vulnerability and response All students of environmental sciences studies and geography should find this book useful It is an introductory text which treats this dramatic subject area as something demanding serious academic treatment and not just as an assemblage of horror stories This book is intended for undergraduate students in geography and environmental studies sciences The book should also appeal to any professional or researcher concerned with man environment relations whether in social science or natural science or engineering
