**Kapteyn** Pieter C. van der Kruit, 2020-12-28 This non technical biography of Jacobus Cornelius Kapteyn 1851 1922 presents to the general reader the scientific life of the astronomer who pioneered the studies of the structure of the Milky Way Galaxy In telling Kapteyn s story the author weaves in astronomy basics and uses modern astronomical images to show the developments of astronomical research from Kapteyn s times to the present In particular the study of the distribution of stars in space has now culminated with spectacular new insights coming from the astrometric satellite GAIA which is receiving much public attention today The biography shows how Kapteyn s ideas influenced prominent astronomers worldwide He is prominent as designer of the Kapteyn Universe the alternative to the large system found by Harlow Shapley He is the

discoverer of Kapteyn's Star still the second fastest moving star in the sky which is now one of the nearest stars with a planet in the habitable zone This fascinating hybrid of astronomy history and popular astronomy tells the story of the astronomy professor without an observatory who founded the first astronomical laboratory specializing in measuring photographic plates exposed elsewhere Kapteyn took astronomy out of cataloguing stars to measuring distances and velocities in order to study their spatial distribution systematic motions Kapteyn's Star Streams and the equilibrium between their gravity and motions His legacy includes in addition to the first application of Galactic structure and dynamics Jan Hendrik Oort the famous astronomer from Leiden who as a student was so impressed by Kapteyn's lectures that he decided to become an astronomer

*Minding the Heavens* Leila Belkora, 2002-12-01 Today we accept that we live on a planet circling the sun that our sun is just one of billions of stars in the galaxy we call the Milky Way and that our galaxy is but one of billions born out of the big bang Yet as recently as the early twentieth century the general public and even astronomers had vague and confused notions about what lay beyond

Willem de Sitter Jan Guichelaar, 2018-09-21 This is a thorough very readable and excellently illustrated biography of Willem de Sitter 1872-1934 one of the most influential astronomers of his time and also a co author and correspondent of Einstein Authored by a physicist and skilled writer the book gives a beautiful and accessible description of the physics debated by Einstein and de Sitter as well as the latter's alternative cosmological model later known as the De Sitter Universe But this is just part of a fascinating and varied life story involving numerous contributions to astronomy as well as many places and personalities of early 20th century physics The book will appeal to all those interested in astronomy and physics and their history

**The Laboratory Revolution and the Creation of the Modern University, 1830-1940** Klaas Berkel, Ernst Homburg, 2025-10-01 The modern research university originated in Europe in the second half of the nineteenth century largely due to the creation and expansion of the teaching and research laboratory The universities and the sciences underwent a laboratory revolution that fundamentally changed the nature of both This revolutionary development began in chemistry where Justus Liebig is credited with systematically employing his students in his ongoing research during the 1830s Later this development spread to other fields including the social sciences and the humanities The consequences for the universities were colossal The expansion of the laboratories demanded extensive new building programs reshaping the outlook of the university The social structure of the university also diversified because of this laboratory expansion while what it meant to be a scientist changed dramatically This volume explores the spatial social and cultural dimensions of the rise of the modern research laboratory within universities and their consequent reshaping

Multielement System Design in Astronomy and Radio Science L.E. Kopilovich, L.G. Sodin, 2013-03-09 The multielement systems have been widely used in many fields of astronomy and radio science in the last decades This is caused by the increasing demands on the resolution and sensitivity of such systems over the wide range of the electromagnetic wavelengths from gamma up to radio The ground based optical and radio interferometers gamma ray and X ray or bital telescopes antenna arrays of radio telescopes and also some other radio devices belong to scientific instruments using multielement systems There fore the current problems of the optimal construction of such systems or precisely those of searching for the best arrangement of the elements in them were formulated A rather large number of scientific papers including those of the authors is devoted to these problems and we believe that the time has come to integrate the basic results of the papers into the mono graph The offered book consists of three parts The first part is concerned with the optimal synthesis of optical and radio interferometers of various types and purposes the synthesis of non equidistant antenna arrays is considered in the second part and the methods for the construction of coded masks for X ray and gamma ray orbital telescopes are expounded in the third one Since in the text combinatorial constructions which are little known to astronomers are used the necessary information is given in the appendices Various tables containing the parameters of the systems considered are also represented

**Organizations and Strategies in Astronomy** Andre Heck, 2000 We have arrived at the third volume of this useful series on Organizations and Strategies in Astronomy OSA It contains seventeen articles on a wide range of topics from virtual observatories astronomy organizations in various communities Czech Republic Slovak Republic South Africa and the role of ground stations in space observatories to quality assurance in UK higher education In this foreword I shall give some views on ideas expressed in this volume in particular from my personal

experience when I was project officer for the Canada France Hawaii Telescope CFHT Let me first remind readers that present and future astronomy is increasingly dependent on high level management Not everybody knows that the scheduling of the Hubble Space Telescope is performed by a neural network software called SPIKE described in the stimulating workshop New Observing Modes for the Next Century<sup>1</sup> partly reported in OSA Volume II by 1 Robson New observing facilities in space or on the ground are so complex that they need highly qualified engineers and rigorous management procedures Each observing hour on the Very Large Telescope VLT facility is worth about EUR 7 000 including the amortization of the capital expenses over 30 years This does not leave much room for amateurism neither in the time allocation procedures nor in the daily telescope control

### **Information Handling in Astronomy - Historical Vistas**

Andre Heck,2003-03-31 This book offers a unique review of how astronomical information handling in the broad sense evolved in the course of the 20th century and especially during its second half It will be very useful for researchers teachers editors publishers librarians computer scientists sociologists of science research planners and strategists project managers public relations officers plus those in charge of astronomy related organizations as well as by students aiming at a career in astronomy or related space science

Radio Recombination Lines M.A. Gordon,Roman L. Sorochenko,2012-12-06

Recombination lines at radio wavelengths have been and still are a powerful tool for modern astronomy. For more than thirty years they have allowed astronomers to probe the gases from which stars form. They have even been detected in the Sun. In addition, observations of these spectral lines facilitate basic research into the atom in forms and environments that can only exist in the huge dimensions and extreme conditions of cosmic laboratories. We intend this book to serve as a tourist's guide to the world of Radio Recombination Lines. It contains three divisions: a history of their discovery, the physics of how they form, and how their voyage to us influences their spectral profiles, and a description of their many astronomical contributions to date. The appendix includes supplementary calculations that may be useful to some astronomers. This material also includes tables of line frequencies from 12 MHz to 30 THz, AIOJLm as well as FORTRAN computer code to calculate the fine structure components of the lines, to evaluate radial matrix integrals, and to calculate the departure coefficients of hydrogen in a cosmic environment. It also describes how to convert observational to astrophysical units. The text includes extensive references to the literature to assist readers who want more details.

Conceptions of Cosmos Helge Kragh, 2007 This book is a historical account of how natural philosophers and scientists have endeavoured to understand the universe at large, first in a mythical and later in a scientific context. Starting with the creation stories of ancient Egypt and Mesopotamia, the book covers all the major events in theoretical and observational cosmology from Aristotle's cosmos, over the Copernican revolution to the discovery of the accelerating universe in the late 1990s. It presents cosmology as a subject including scientific as well as non-scientific dimensions and tells the story of how it developed into a true science of the heavens. Contrary to most other books in the history of cosmology, it offers an integrated account of the development with emphasis on the modern Einsteinian and post-Einsteinian period. Starting in the pre-literary era, it carries the story onwards to the early years of the 21st century.

**Master of Galactic Astronomy: A Biography of Jan Hendrik Oort** Pieter C. van der Kruit, 2020-12-28 This accessible and entertaining biography chronicles the life and triumphs of astronomer Jan Hendrik Oort, who helped lay the foundations of modern astronomy in the 20th century. The book puts into context some of Oort's most significant achievements, including his discovery that the Milky Way rotates, as well as his famous hypothesis that our Solar System is surrounded by a reservoir of comets now simply known as the Oort Cloud. Written by Oort's former student, this fascinating story also delves into Oort's pivotal role in the foundation of major astronomical facilities, including radio telescopes in the Netherlands and the European Southern Observatory (ESO), which now operates the most successful astronomical observatories in the world. The book draws extensively on new archival research through the Oort Archives, along with personal reminiscences by Oort's son and astronomer grandson, to paint a more detailed picture of Oort's life, not just as an astronomer but also as a husband, father, and citizen. The strong public interest in comets triggered by the Rosetta mission to comet 67P/Churyumov-Gerasimenko and the recently discovered interstellar comet in the Solar System make this book particularly timely.

The Day We Found the Universe Marcia Bartusiak, 2010-03-09 The riveting and mesmerizing story behind a watershed period in human history, the

discovery of the startling size and true nature of our universe On New Years Day in 1925 a young Edwin Hubble released his finding that our Universe was far bigger eventually measured as a thousand trillion times larger than previously believed Hubble's proclamation sent shock waves through the scientific community Six years later in a series of meetings at Mount Wilson Observatory Hubble and others convinced Albert Einstein that the Universe was not static but in fact expanding Here Marcia Bartusiak reveals the key players battles of will clever insights incredible technology ground breaking research and wrong turns made by the early investigators of the heavens as they raced to uncover what many consider one of most significant discoveries in scientific history

The Sun and Space Weather Arnold Hanslmeier, 2002-06-30 Since the Sun is the main source of space weather effects the first part of the book is devoted to a general introduction to the physics of the Sun A better understanding of the phenomena underlying solar activity is also important for prediction of solar outbursts and thus for establishing alert systems for space missions and telecommunication systems The book contains the following topics possible influence of the Sun on the Earth's climate the effects of radiation on humans in space and the expected radiation dose from various solar events disturbances of the Earth's ionosphere and the implications of radio communication at different wavelength ranges possible hazardous asteroids and meteoroids and their detection and space debris and special shielding of spacecraft In the cited literature more detailed information about the topics may be found This book provides an introduction and overview of modern solar terrestrial physics for students as well as for researchers in the field of astrophysics solar physics geophysics and climate research

Plasma Astrophysics Arnold O. Benz, 2002-06-30 This textbook is intended as an introduction to the physics of solar and stellar coronae emphasizing kinetic plasma processes It is addressed to observational astronomers graduate students and advanced undergraduates without a background in plasma physics Coronal physics is today a vast field with many different aims and goals Sorting out the really important aspects of an observed phenomenon and using the physics best suited for the case is a formidable problem There are already several excellent books oriented toward the interests of astrophysicists that deal with the magnetohydrodynamics of stellar atmospheres radiation transport and radiation theory In kinetic processes the different particle velocities play an important role This is the case when particle collisions can be neglected for example in very brief phenomena such as one period of a high frequency wave or in effects produced by energetic particles with very long collision times Some of the most persistent problems of solar physics like coronal heating shock waves flare energy release and particle acceleration are likely to be at least partially related to such processes Study of the Sun is not regarded here as an end in itself but as the source of information for more general stellar applications Our understanding of stellar processes relies heavily in turn on our understanding of solar processes Thus an introduction to what is happening in hot dilute coronae necessarily starts with the plasma physics of our nearest star
