

transverse ridges. A sequential pattern of preparation also allows one to vary severely shape the proximal convexity of the upper surface. It is easy to understand where in this case the confining idea of the endproduct assuming the over-shape comes from. The relief over pattern equally distributes rupture points over the Levallois surface and, hence, the final shape will be largely similar to that of the core (see Figures 21.3 and 21.4).

Some methods that could be considered as sub-varieties of this method have been described:

#### Victoria West Method for Flakes

This is also known as para-Levallois method (Bordes, 1960: 10). The Levallois flake is detached from one of the lateral sides of the core, and then is usually wider than long (Bordes, 1960: 47). Although the method is stated to occur in Africa only before it was described by Van der Leeuw (1948), it has recently been encountered in Belgium at the site of Paveyennes (Wauters, 1976: 87).

#### Race Levallois Method

This method, described by Levallois (1977: 44), is distinguished from the classical by a particular core

shape. The core is triangular; the proximal tip having offset from the rest of its body. An endproduct will assume a sickle-like shape.

#### Rejake Method

The essence of this method has been observed in a number of Nile Valley industries (Van Peer 1982). The pattern of preparation is uniserial, but with a very characteristic distal elaboration. A central guiding edge is implemented, which is then removed by a selective detachment. The latter is always the last preparatory stage before the endproduct is detached from the appropriate striking platform. Thus in this specific distal preparation, an endproduct will show a double pointed distal end.

#### Levallois Method for Flakes with Parallel Preparation

A pattern of parallel longitudinal ridges is created on a Levallois surface by means of a bidirectional or unidirectional pattern of retouching (Van Peer 1982: 49).

A summary of this method is the Dahn method. It has been recognized in the Northern Nile Valley and was described in the following way (Bordes 1960: 106):

Figure 21. Some examples of flake and point Levallois methods. 1. Nelson's point method; 2. Wilson's point method; 3. classical flake method; 4. Hahn's flake method. Reproduced from Van Peer 1982, Figure 3, with permission of Academic Press.

must be parallel the ridges on as far as to support the worker's hand.

- (i) The preparation of a striking platform at the proximal end. At this stage, the core was kept unidirectionally, sometimes at right angles, and sometimes back position.
- (ii) The removal of a Levallois point.

What we have here is a combination of a system of transverse ridges in the proximal part of the upper surface and a central ridge in the distal part. This pattern of ridges shows two prominent points in a morphological sense (triangular flaked but rather pointed flake).

#### Rejake Method Type I

This method (Figure 21.7), again recognized in the Nile Valley, was also described by J. and G. Gauthier (1960: 46):

This Levallois core, often of triangular shape, or sub-triangular, gives pointed flake or points of Levallois technique, which are not, in a strict sense, Levallois points because their distal distal along a ridge. They are often prepared on platforms, and when they are prepared on a thick rich than base is semi-shaped or sub-circular. The distal end presents a protruding point, a real extremity, the striking platform at the end is well prepared, peripheral retouching on the distal surface are regularly carried out so that, in the case of a sub-circular core, it might result a blade.

According to this description, the method should rather be integrated as a sub-variety of the classical method by Levallois. Indeed, the core pattern implements a system of transverse ridges. One might, however, argue that the transverse disposition of some marks is a fairly unusual edge which will give way to a pointed flake and, therefore, the method has to be kept among the point methods.

#### Blade Methods

Although a Levallois method for blades has been argued to exist on several occasions, it will be clear now that, in terms of the pattern of preparation, and to be applied to it, introduction, there is no difference whatsoever with the described methods for flake production. Thus, from that point of view, the distinction between Levallois flake and blade can only be a morphological one. Levallois blades are flakes with a morphological core. Levallois blades are flakes with a

- (i) An indicated or straight-backed striking platform is created at one side of a pebble, with a specific angle to the upper surface.
- (ii) A series of parallel or subparallel longitudinal ridges are struck from this platform.
- (iii) Prior to the removal of some sub-circular, a wide distal platform is shaped on the other end of the core. A number of flakes starting from this platform remove the cores from the upper surface of the core. Afterwards, the distal platform is transformed into a series of small platforms.
- (iv) A short, wide flake is struck from this new platform. It removes the cores of the preparatory flakes. It does not usually reach the upper longitudinal core.
- (v) The platform is again transformed, this time in shape of a pebble.
- (vi) A blade flake is struck off.

It will be clear from this description that the pattern of preparation applied is essentially a bidirectional one by means of which a system of longitudinal ridges is created. This pattern of ridges will result in a series of less rectangular endproducts.

#### Point Methods

##### Classical Levallois Point Method (Bordes, 1960: 47)

Two transverse longitudinal preparatory strokes, struck either from the proximal or distal striking platform, create a central guiding ridge on the upper surface. This ridge is going to determine a pointed distal end on the endproduct.

##### Norhis Method Type I

This method has been noticed about long in Egyptian Paleolithic assemblages (Figure 21.8). It was described systematically by Gauthier and Gauthier (1960: 46). The main platform of the technique are as follows (as taken from Gauthier and Gauthier 1960: 46):

- (i) Flaking off the periphery of a pebble to obtain an oval thick core.
- (ii) At the distal (and proximal) end, the removal of two elongated flakes or English blades by symmetrical with longitudinal flake close to each other; the bases of several of such flakes are delineated by a short ridge approximately to the core symmetry axis.
- (iii) Towards the base, retouching starting from the description described in (i) apparently

**Examining the Levallois Reduction Strategy from a Design Theory Point of View** Dennis M. Sandgathe, 2005 This research examines the potential advantages of the Levallois reduction strategy that led to its long history of use developing a model of Middle Palaeolithic lifeways to identify factors that influenced and constrained the design of stone technology and tool kits From this hypotheses are developed to explain the advantages that Levallois reduction would present These hypotheses are then tested through analysis of the morphology of the products of different reduction strategies and of tool blank selection patterns at sites in southern France This analysis indicates that Levallois reduction would present notable advantages under conditions of restricted access to raw material Some functional advantages may also rest in the morphology of certain Levallois products It is also apparent that classic Levallois reduction cannot be defined in isolation from other single surface core strategies and that much of the advantage of classic Levallois reduction is inherent in all such strategies
