The Magnetospheric Structure And Emission Mechanisms Of Radio Pulsars:

The Magnetospheric Structure and Emission Mechanisms of Radio Pulsars International Astronomical Union. Colloquium, 1992 **Magnetosphere Structure and Radiation Mechanisms of Pulsars** Derek Harry Roberts, Peter Andrew Sturrock, J. S. Turk, 1973 **Physics of the Pulsar Magnetosphere** V. S. Beskin, A. V. Gurevich, Ya. N. Istomin, 1993-07-29 This book presents the theory of the electrodynamic phenomena that occur in the magnetosphere of a pulsar. It also provides a clear picture of the formation and evolution of neutron stars. The authors address the basic physical processes of electron-positron plasma production, the generation of electric fields and currents, and the emission of radio waves and gamma rays. The book also reviews the current observational data and devotes a complete chapter to a detailed comparison of this data with accepted theory and with some recent theoretical predictions. Tables containing the values of the physical parameters of all observed radio pulsars are also provided. **Magnetospheric Structure of Rotation Powered Pulsars**, 1991. I survey recent theoretical work on the structure of the magnetospheres of rotation-powered pulsars within the observational constraints set by their observed spindown, their ability to power synchrotron nebulae, and their ability to produce beamed collective radio emission while putting only a small fraction of their energy into incoherent X and gamma radiation. I find no single theory has yet given a consistent description of the magnetosphere, but I conclude that models based on a dense outflow of pairs from the polar caps permeated by a lower density flow of heavy ions are the most promising avenue for future research. 106 refs, 4 figs, 2 tabs. **The Magnetospheric Structure of Pulsars** David Hall Roberts, 1973 **An Exotic Type of Pulsar — Intermittent Pulsar** Abdujappar Rusul, 2023-10-19 This monograph is based on my research work in pulsar astronomy in which Chapters 3, 4, 6, 8, and 9 are mainly based on the previous works that need to be interpreted more deeply with the current progress in the relevant areas of the subjects. I hope this work will provide more insights about the state switching of intermittent pulsars and the corresponding change in the pulsar magnetosphere. The link to the original paper is given under each chapter for convenience. I believe this monograph may have many defects and shortcomings. Any comments or suggestions are highly appreciated. **Isolated Pulsars** K. A. van Riper, R. Epstein, Cheng Ho, 1993-03-25 The extreme properties of pulsars demand a broad range of physics. From The Los Alamos Workshop on Isolated Pulsars, contributions have been selected to encompass all aspects of pulsar detection and understanding. Recent observational highlights include results from the Compton Gamma Ray Observatory, ROSAT, and GINGA, and the Hubble Space Telescope. Well-illustrated theoretical contributions cover a wide range of topics. This volume forms a comprehensive and up-to-date guide to the observation and theory of solitary neutron stars. **Exploring the Magnetospheric and Rotational Properties of Radio Pulsars** Marcus Edward Lower, 2022 **Pulsar Phenomena** Sophia Anderson, AI, 2025-03-04 Pulsars, rapidly rotating neutron stars, are cosmic beacons that emit electromagnetic radiation, offering insights into extreme physics and the very fabric of spacetime. Pulsar Phenomena explores these celestial

objects emphasizing their role as invaluable probes of fundamental physics and cosmology. Their predictable pulsations enable precise measurements facilitating tests of general relativity and searches for gravitational waves. The book presents a comprehensive overview of pulsar formation, structure and emission mechanisms, highlighting their significance in understanding the universe's most enigmatic phenomena. The book progresses from foundational concepts of stellar evolution and electromagnetism to detailed explanations of pulsar emission mechanisms and their diverse types, such as radio, X-ray and millisecond pulsars. It then delves into their applications in astrophysics, focusing on testing general relativity and detecting gravitational waves. A unique aspect of pulsars is their extreme density and magnetism, allowing scientists to test the limits of physical theories. The book's structure guides readers through a comprehensive understanding supported by observational data from various telescopes and observatories, offering a holistic view of these objects' role in astrophysics.

X-ray Timing of Young Pulsars Robert Archibald, 2017. Pulsars are the rotating compact remnants of exploded massive stars. The region surrounding the neutron star, known as the magnetosphere, has properties which are determined by the magnetic field of the star. In this thesis, I present several observational results involving rotation-powered radio pulsars and magnetars, which indicate that pulsar magnetospheres have a more complex structure than a simple dipole and that the magnetosphere can have a strong effect on all the observed properties of neutron stars. One way to probe the pulsar magnetosphere is through the measurement of braking indices. A braking index quantifies the dependence of the torque on the spin frequency. In Chapter 4, I present a long-term timing study of the rotation-powered pulsar PSR J1846-0258, where we show that the change in braking index reported in this source is long-lived. The most plausible explanation for this changed braking index appears to be due to a change in magnetospheric configuration. In Chapter 5, I present the measurement of a new braking index for the rotation-powered pulsar PSR J1640-4631 of $n = 3.15 \pm 0.03$, the first measured braking index higher than the canonical three of a magnetic dipole. This result demonstrates that other physical mechanisms, such as mass or magnetic quadrupole moments, most likely need to be taken into account to describe pulsar spin-down energetics. Another way to probe the magnetospheres of pulsars is by studying the extreme variability seen in the magnetar class. In Chapter 6, I present two years of flux and spin evolution monitoring of the magnetar 1E 1048.1-5937 following an outburst. By comparing to previous outbursts from the source, we show that this pattern of behaviour repeats itself with a quasi-period of 1800 days. This behaviour, when compared to similar, less extreme events seen in rotation-powered pulsars, appears to implicate processes in the stellar magnetosphere. In Chapter 7, I present the results of monitoring the magnetar 4U 0142.6+61 over two outbursts, including one with a net spin-down timing event, and compare this timing event to previous such events in other pulsars with high magnetic fields and discuss net spin-down glitches now seen in several young, high-B pulsars. The observations that these spin-down events occur in only high-B sources strongly implicate the influence of a large magnetic field in spin-down events, and coupled with the radiatively loud nature of the plurality of spin-down events, suggests an origin

in the magnetosphere of the star In Chapter 8 I present observations of a magnetar like outburst from the high magnetic field pulsar PSR J1119 6127 providing an unambiguous connection between the radio pulsar and magnetar populations Finally in Chapter 9 I put these new results in context with recent advances in neutron star astrophysics and speculate on avenues for future advancement in the field
