

THE EFFECTS OF TEMPERATURE ON PROTEIN SYNTHESIS

The two aspects of the temperature response of plants that are most interesting are (a) the short-term responses to high and low temperatures and (b) the adaptive responses.

The short-term responses are largely determined by the activation energies of the complex of reactions that make up the process of protein synthesis. In those studies where the response of growth can be compared with that of protein synthesis, an important generality emerges: Protein synthesis occurs at the highest rate at those temperatures that also give the highest rates of growth for the plant. Beevers *et al.* (1965) have shown that the optimum temperature for NR synthesis in leaves of maize was 35°C. This compares with an optimum for leaf growth at 35°C for leaves of maize (Watts, 1972). For radish, the optimum for protein synthesis was 31°C (Beevers *et al.*, 1965). Radish grows well in cool seasons. Leaf growth in bean, which also does well at cool temperatures, has an optimum for leaf growth at 25–30°C (Wilson and Ludlow, 1969).

In the bacteria, a similar correspondence between growth and protein synthesis holds true. Friedman *et al.* (1969) showed that free 30S and 50S ribosomal subunits accumulate when *E. coli*, a mesophile, is grown at 8°C. In this species, cell division virtually ceases at 8°C. These authors conclude that the formation of some portion of the initiation complex was inhibited by cold but that peptide chains could be completed if they had already been initiated.

Micrococcus cryophilus, a psychrophilic bacterium that grows poorly above 25°C, exhibits an inhibition of protein synthesis above this temperature (Malcolm, 1969). In this species, the block can be traced to the amino acyl transferases for glutamate and proline. These two enzymes lose activity for the cognate species of tRNA at these temperatures, in part because of changes in the tRNA's to configurations that are unfavorable for the enzymes and in part due to changes in the enzymes themselves. Somewhat similar results have been found with the psychrophilic yeast *Candida gelida* (Nash *et al.*, 1969). Several amino acyl tRNA synthetases appear to be denatured at temperatures above the growth optimum (25–30°C). Leucyl tRNA synthetase was most affected. In addition to the synthetases, the formation of ribosome-bound polypeptide chains was also inhibited at high temperatures.

It is perhaps not surprising that the temperature sensitivity of growth and protein synthesis are correlated. Cells require new protein for

Chemistry of Structure-Function Relationships in Cheese Edyth L. Malin,Michael H. Tunick,2013-11-11 Although the art of making cheese can be traced to prehistoric times it has continued to evolve as modern civilization progressed The advent of new technologies and instrumentation has brought exponential growth in the understanding of cheese components and their function Even more recently the evolution of cheesemaking has accelerated driven by economic factors such as the establishment of the European Economic Community the changing diet of developed countries and the environmental and economic concerns associated with whey disposal Molecular biology has revolutionized the development of starter and adjunct cultures as well as rennets and genetics will make it possible to maintain ideal milk components for cheesemaking The ability to accelerate

traditional ripening procedures has altered the production of certain cheeses and the emphasis on decreasing the intake of dietary fat especially in the United States has prompted the development of technology for producing low fat cheeses with traditional texture and flavor In assembling a distinguished group of participants for the symposium Chemistry of the Structure Function Relationships in Cheese we hoped to review the interplay of these trends and forecast the direction of future research Contributors evaluated the current status of cheesemaking and highlighted the information that will be essential for new developments They also focused the attention of agricultural and food chemists on the opportunities in cheese research and the potential contributions they might make to the future of cheese a most valuable food product We are indebted to Dr Patrick Fox Dr Mark Johnson Dr Milos Kalab Dr *Bibliography of Agriculture* ,1990 Library of Congress Catalogs Library of Congress,1979
