Small Scale Map Projection Design:

Small-Scale Map Projection Design Frank Canters, 2002-02-21 The use of computers in cartography has made it easier for map makers to transform data from one map projection to another and experiment with alternative representations of geographical data This has created new challenges and opportunities for map projection scientists Small Scale Map Projection Design focuses on numerical map projection research and is written from the perspective of the map projection user It demonstrates how advances in the measurement of map projection distortion and in the development of low error map projections can help map makers decide what type of map projection is best for their purpose and shows how they can eventually design their own map projections

Cartography Jochen Schiewe, 2025-09-02 What would our lives look like if there were no good maps Maps are essential for orientation navigation and simplifying complex environments ultimately enhancing our understanding of the world The visualization of geospatial data supports both laypeople and experts in various aspects of life whether in personal professional or scientific contexts With the growing availability of maps online they are increasingly used in daily life on devices such as smartphones and tablets However the surge in map creation does not necessarily equate to the production of good maps those that effectively and efficiently fulfill their intended purpose This book explores the full breadth of the field of Cartography It delves into the core of the discipline focusing on the graphical representation of geospatial data spatial reference and map projections Additionally it addresses key peripheral topics that contribute to a comprehensive understanding such as usability testing data collection and processing and cartographic law Rather than providing technical

or software specific guidance the author emphasizes the fundamental concepts and methods of modern Cartography. Introductory chapter overviews numerous illustrations and practical exercises support this approach. This textbook is a valuable resource for students and educators across various fields: Cartography, Geography, Geodesy, Urban and Regional Planning, Environmental Sciences and more. It aids in the creation and use of good maps and provides a solid foundation in modern Cartography for anyone with an interest in maps.

Map Projections Erik W. Grafarend, Rey-Jer You, Rainer Syffus, 2014-09-11. In the context of Geographical Information Systems (GIS) the book offers a timely review of Map Projections. The first chapters are of foundational type. We introduce the mapping from a left Riemann manifold to a right one specified as conformal, equiareal and equidistant perspective and geodetic. In particular the mapping from a Riemann manifold to a Euclidean manifold plane and the design of various coordinate systems are reviewed. A speciality is the treatment of surfaces of Gaussian curvature zero. The largest part is devoted to the mapping the sphere and the ellipsoid of revolution to tangential plane, cylinder and cone, pseudo cone using the polar aspect, transverse as well as oblique aspect. Various Geodetic Mappings as well as the Datum Problem are reviewed. In the first extension we introduce optimal map projections by variational calculus for the sphere respectively the ellipsoid generating harmonic maps. The second extension reviews alternative maps for structures namely torus, pneu, hyperboloid, cooling tower, paraboloid, parabolic mirror, onion shape, church tower as well as clothoid. High Speed Railways used in Project Surveying. Third we present the Datum Transformation described by the Conformal Group $C_{10,3}$ in a three-dimensional Euclidean space, a ten parameter conformal transformation. It leaves infinitesimal angles and distance ratios equivariant. Numerical examples from classical and new map projections as well as twelve appendices document the Wonderful World of Map Projections.

Rediscovering the World Benjamin Hennig,2012-12-14 We need new maps is the central claim made in this book In a world increasingly influenced by human action and interaction we still rely heavily on mapping techniques that were invented to discover unknown places and explore our physical environment Although the traditional concept of a map is currently being revived in digital environments the underlying mapping approaches are not capable of making the complexity of human environment relationships fully comprehensible Starting from how people can be put on the map in new ways this book outlines the development of a novel technique that stretches a map according to quantitative data such as population The new maps are called gridded cartograms as the method is based on a grid onto which a density equalising cartogram technique is applied The underlying grid ensures the preservation of an accurate geographic reference to the real world It allows the gridded cartograms to be used as basemaps onto which other information can be mapped This applies to any geographic information from the human and physical environment As demonstrated through the examples presented in this book the new maps are not limited to showing population as a defining element for the transformation but can show any quantitative geospatial data such as wealth rainfall or even the environmental conditions of the oceans The new maps also work at various scales from a global perspective down to the scale of urban environments The gridded cartogram technique is proposed as a new global and local map projection that is a viable and versatile alternative to other conventional map projections The maps based on this technique open up a wide range of potential new applications to rediscover the diverse geographies of the world They have the potential to allow us to gain new perspectives through detailed cartographic depictions
