Summary **Objectives:** The prevalence of cigarette smoking among Japanese men has been consistently high compared with males in Western countries over the past 30 years. However, during the same period, the incidence and mortality rates for lung cancer have been consistently lower in Japan than in Western countries, which has been termed the 'Japanese smoking paradox'. The odds ratio/relative risk of cigarette smoking for lung cancer mortality and incidence for the same number of cigarettes smoked per capita in Japan have been lower than those in Western countries. This difference in the odds ratio/relative risk is likely to be the main reason for the Japanese smoking paradox. The aim of this study was to clarify the reason for the difference in the odds ratio/relative risk between Japan and the USA. **Study design:** Literature review to compare environmental, hereditary and other factors that may be related to lung cancer in Japan and the USA. **Results and conclusions:** The main factors likely to have brought about the difference in the odds ratio/relative risk between Japan and the USA (and perhaps other Western countries as well) are: lower alcohol consumption by Japanese males;

Patient-Centered Clinical Care for African Americans Gregory L. Hall, 2019-11-27. This title is an easy-to-read guide outlining specific differences in communication, clinical therapies, medications, protocols, and other critical approaches to the care of African Americans. The book discusses a wide range of disorders impacting African Americans and takes a comprehensive and evidence-based approach to the clinical support of providers that see African American patients. Recording the worst medical outcomes of any racial/ethnic group in America, African Americans have the highest mortality, longest hospital length of stay, worst compliance with medications and referrals, and the lowest trust of the healthcare system. Indeed, there are countless well-designed studies that validate verified differences in the clinical care of a number of pervasive diseases in African Americans, including hypertension, heart disease, kidney disease, obesity, cancer, and more. Despite the widespread acknowledgement of the existence of health disparities among racial/ethnic groups, the overall outcomes for African Americans are still the most shocking. From high infant mortality to death by almost any cause, African Americans have the worst data of any other racial or ethnic group. *Patient-Centered Clinical Care for African Americans*, a highly practical and first-of-its-kind title, illuminates these alarming issues and represents a major contribution to the clinical literature. It will be of significant interest to all physicians, clinicians, and allied health personnel.

Quantum Structures in Cognitive and Social Science Diederik Aerts, Jan Broekaert, Liane Gabora, Sandro Sozzo, 2016-06-26 Traditional approaches to cognitive psychology correspond with a classical view of logic and probability theory More specifically one typically assumes that cognitive processes of human thought are founded on the Boolean structures of classical logic while the probabilistic aspects of these processes are based on the Kolmogorovian structures of classical probability theory However growing experimental evidence indicates that the models founded on classical structures systematically fail when human decisions are at stake These experimental deviations from classical behavior have been called paradoxes fallacies effects or contradictions depending on the specific situation where they appear But they involve a broad spectrum of cognitive and social science domains ranging from conceptual combination to decision making under uncertainty behavioral economics and linguistics This situation has constituted a serious drawback to the development of various disciplines like cognitive science linguistics artificial intelligence economic modeling and behavioral finance A different approach to cognitive psychology initiated two decades ago has meanwhile matured into a new domain of research called quantum cognition Its main feature is the use of the mathematical formalism of quantum theory as modeling tool for these cognitive situations where traditional classically based approaches fail Quantum cognition has recently attracted the interest of important journals and editing houses academic and funding institutions popular science and media Specifically within a quantum cognition approach one assumes that human decisions do not necessarily obey the rules of Boolean logic and Kolmogorovian probability and can on the contrary be modeled by the quantum mechanical formalism Different concrete quantum theoretic models have meanwhile been developed that successfully represent the cognitive situations that are classically problematical by explaining observed deviations from classicality in terms of genuine quantum effects such as contextuality emergence interference superposition entanglement and indistinguishability In addition the validity of these quantum models is convincingly confirmed by new experimental tests We also stress that since the use of a quantum theoretic framework is mainly for modeling purposes the identification of quantum structures in cognitive processes does not presuppose without being incompatible with it the existence of microscopic quantum processes in the human brain In this Research Topic we review the major achievements that have been obtained in quantum cognition by providing an accurate picture of the state of the art of this emerging discipline Our overview does not pretend to be either complete or exhaustive But we aim to introduce psychologists and social scientists to this challenging new research area encouraging them at the same time to consider its promising results It is our opinion that if continuous progress in this domain can be realized quantum cognition can constitute an important breakthrough in cognitive psychology and potentially open the way towards a new scientific paradigm in social science
