The Hidden Model:

Inference in Hidden Markov Models Olivier Cappé, Eric Moulines, Tobias Ryden, 2006-04-12 Hidden Markov models have become a widely used class of statistical models with applications in diverse areas such as communications engineering, bioinformatics, finance, and many more. This book is a comprehensive treatment of inference for hidden Markov models, including both algorithms and statistical theory. Topics range from filtering and smoothing of the hidden Markov chain to parameter estimation, Bayesian methods, and estimation of the number of states. In a unified way, the book covers both models with finite state spaces, which allow for exact algorithms for filtering, estimation, etc., and models with continuous state spaces, also called state space models, requiring approximate simulation-based algorithms that are also described in detail. Simulation in hidden Markov models is addressed in five different chapters that cover both Markov chain Monte Carlo and sequential Monte Carlo approaches. Many examples illustrate the algorithms and theory. The book also carefully treats Gaussian linear state space models and their extensions, and it contains a chapter on general Markov chain theory and probabilistic aspects of hidden Markov models. This volume will suit anybody with an interest in inference for stochastic processes, and it will be useful for researchers and practitioners in areas such as statistics, signal processing, communications engineering, control theory, econometrics, finance, and more. The algorithmic parts of the book do not require an advanced mathematical background, while the more theoretical parts require knowledge of probability theory at the measure-theoretical level. From the reviews: By providing an overall survey of results obtained so far in a very readable manner and also presenting some new ideas, this well-written book will appeal to academic researchers in the field of HMMs, with PhD students working on related topics included. It will also appeal to practitioners and researchers from other fields by guiding them through the computational steps needed for making inference HMMs and/or by providing them with the relevant underlying statistical theory. In the reviewer's opinion, this book will shortly become a reference work in its field. MathSciNet. This monograph is a valuable resource. It provides a good literature review, an excellent account of the state of the art, research on the necessary theory and algorithms, and ample illustrations of numerous applications of HMM. It goes much beyond the earlier resources on HMM. I anticipate this work to serve well many Technometrics readers in the coming years. Haikady N. Nagaraja for Technometrics, November 2006. [Semi-Markov Chains and Hidden Semi-Markov Models toward Applications](#) Vlad Stefan Barbu, Nikolaos Limnios, 2009-01-07 Here is a work that adds much to the sum of our knowledge in a key area of science today. It is concerned with the estimation of discrete-time semi-Markov and hidden semi-Markov processes. A unique feature of the book is the use of discrete time, especially useful in some specific applications where the time scale is intrinsically discrete. The models presented in the book are specifically adapted to reliability studies and DNA analysis. The book is mainly intended for applied probabilists and statisticians interested in semi-Markov chains, theory, reliability, and DNA analysis, and for theoretical-oriented reliability and bioinformatics engineers. *Hidden Markov Models* Ramaprasad Bhar, Shige-yuki

Dynamic Speech Models Li Deng, 2022-05-31. Speech dynamics refer to the temporal characteristics in all stages of the human speech communication process. This speech chain starts with the formation of a linguistic message in a speaker's brain and ends with the arrival of the message in a listener's brain. Given the intricacy of the dynamic speech process and its fundamental importance in human communication, this monograph is intended to provide a comprehensive material on mathematical models of speech dynamics and to address the following issues: How do we make sense of the complex speech process in terms of its functional role of speech communication? How do we quantify the special role of speech timing? How do the dynamics relate to the variability of speech that has often been said to seriously hamper automatic speech recognition? How do we put the dynamic process of speech into a quantitative form to enable detailed analyses? And finally, how can we incorporate the knowledge of speech dynamics into computerized speech analysis and recognition algorithms? The answers to all these questions require building and applying computational models for the dynamic speech process. What are the compelling reasons for carrying out dynamic speech modeling? We provide the answer in two related aspects. First, scientific inquiry into the human speech code has been relentlessly pursued for several decades. As an essential carrier of human intelligence and knowledge, speech is the most natural form of human communication. Embedded in the speech code are linguistic as well as para-linguistic messages which are conveyed through four levels of the speech chain. Underlying the robust encoding and transmission of the linguistic messages are the speech dynamics at all the four levels. Mathematical modeling of speech dynamics provides an effective tool in the scientific methods of studying the speech chain. Such scientific studies help understand why humans speak as they do and how humans exploit redundancy and variability by way of multitiered dynamic processes to enhance the efficiency and effectiveness of human speech communication. Second, advancement of human language technology, especially that in automatic recognition of natural style human speech, is also expected to benefit from comprehensive computational modeling of speech dynamics. The limitations of current speech recognition technology are serious and are well known. A commonly acknowledged and frequently discussed weakness of the statistical model underlying current speech recognition technology is the lack of adequate dynamic modeling schemes to provide correlation structure across the temporal speech observation sequence. Unfortunately, due to a variety of reasons, the

majority of current research activities in this area favor only incremental modifications and improvements to the existing HMM based state of the art For example while the dynamic and correlation modeling is known to be an important topic most of the systems nevertheless employ only an ultra weak form of speech dynamics e g differential or delta parameters Strong form dynamic speech modeling which is the focus of this monograph may serve as an ultimate solution to this problem After the introduction chapter the main body of this monograph consists of four chapters They cover various aspects of theory algorithms and applications of dynamic speech models and provide a comprehensive survey of the research work in this area spanning over past 20 years This monograph is intended as advanced materials of speech and signal processing for graudate level teaching for professionals and engineering practioners as well as for seasoned researchers and engineers specialized in speech processing
