

Resuspension of Lead (Pb) in Oakland, CA Investigating a Possible Source of Urban Lead Contamination

Marlene Goh-Cris, Daniel Lopez, Jason Lopez

1068

Introduction

Lead (Pb) is a toxic metal that can cause serious health problems, especially in children. It is found in many everyday items, including paint, pipes, and gasoline. In Oakland, CA, there is a high concentration of lead in the soil, which is a result of historical lead contamination. This project aims to investigate the resuspension of lead in the air and its potential contribution to urban lead contamination.

Methods

We used a combination of field measurements and laboratory experiments to study the resuspension of lead. Field measurements were taken at various locations in Oakland, including a busy street and a residential area. Laboratory experiments were conducted to determine the resuspension rate of lead from different surfaces under various conditions.

Results

Our results show that the resuspension of lead is a significant source of urban lead contamination. The highest concentrations of lead were found in the air near the busy street, and the resuspension rate was highest for the most contaminated surfaces. The laboratory experiments confirmed that the resuspension rate is influenced by factors such as wind speed and surface texture.

Conclusion

Our findings suggest that the resuspension of lead is a major source of urban lead contamination in Oakland, CA. This information can be used to develop strategies to reduce lead exposure, such as improving indoor air quality and implementing lead abatement programs.
