

The background of the entire page is a detailed technical drawing of an aircraft, likely a biplane or a similar vintage model, shown from a side profile. The drawing is rendered in a light blue or white line style against a darker blue background. It includes various components like the fuselage, wings, tail, and landing gear, with some parts labeled with letters and numbers. The overall style is that of a classic engineering or aviation blueprint.

Small Model Planbooks: Flying scale rubber models, vol. 1 ,1997 **CO2 Powered Model Aircraft** Tony Brookes,2002-04-18 This comprehensive guide to CO2 power will help both beginners and experienced modellers to take advantage of the CO2 technology The basic principles are described and the newcomer is guided through the initial learning process More advanced motors are also described and the design of CO models is discussed in detail Geological Storage of CO2 Jan Martin Nordbotten,Michael A. Celia,2011-10-24 Despite the large research effort in both public and commercial companies no textbook has yet been written on this subject This book aims to provide an overview to the topic of Carbon Capture and Storage CSS while at the same time focusing on the dominant processes and the mathematical and numerical methods that need to be employed in order to analyze the relevant systems The book clearly states the carbon problem and the role of CCS and carbon storage Thereafter it provides an introduction to single phase and multi phase flow in porous media including some of the most common mathematical analysis and an overview of numerical methods for the equations A considerable part of the book discusses the appropriate scales of modeling and how to formulate consistent governing equations at these scales The book also illustrates real world data sets and how the ideas in the book can be exploited through combinations of analytical and numerical approaches **Computational Models for CO2 Geo-Sequestration and Compressed Air Energy Storage**

Rafid Al-Khoury,Jochen Bundschuh,2017-03-29 A comprehensive mathematical and computational modeling of CO2 Geosequestration and Compressed Air Energy Storage Energy and environment are two interrelated issues of great concern to modern civilization As the world population will soon reach eight billion the demand for energy will dramatically increase intensifying the use of fossil fuels Utilization of fossil fuels is by far the largest anthropogenic source of CO2 emission into the earth s atmosphere This unavoidable reality necessitates efforts to mitigate CO2 from indefinitely being emitted in the atmosphere CO2 geo sequestration is currently considered to be a vital technology for this purpose Meanwhile and as fossil fuels will sooner or later be depleted utilization of renewable energy resources is inevitable Nowadays wind and solar energy being clean and sustainable are gaining momentum However their availability is intermittent This intermittent nature of solar and wind energy necessitates storing the produced energy at off peak times for later use Compressed air energy storage in subterranean caverns aquifers and coal seams is currently considered to be a plausible technology for this purpose CO2 geo sequestration and compressed air energy storage are thus

vital technologies for current and future energy strategy development. These technologies can be made safe and cost effective by utilizing computational tools capable of simulating the involved multiphysical phenomena and processes. Computational modeling of such systems is challenging and resource consuming. Meeting such a challenge constitutes the focal point of this book. This book addresses comprehensive theoretical and computational modeling aspects of CO₂ geosequestration and compressed air energy storage. The book consists of 16 chapters authored by prominent researchers in these two fields. The authors of the book endeavoured to present years of innovative work making it available for a wide range of readers including geoscientists, poromechanists, applied mathematicians, computational geoscientists, geologists, and reservoir engineers.

Simplified Predictive Models for CO₂ Sequestration Performance Assessment Research Topical Report on Task #3 Statistical Learning Based Models, 2014. We compare two approaches for building a statistical proxy model (metamodel) for CO₂ geologic sequestration from the results of full physics compositional simulations. The first approach involves a classical Box Behnken or Augmented Pairs experimental design with a quadratic polynomial response surface. The second approach used a space filling maximin Latin Hypercube sampling or maximum entropy design with the choice of five different meta modeling techniques: quadratic polynomial kriging with constant and quadratic trend terms, multivariate adaptive regression spline (MARS), and additivity and variance stabilization (AVAS). Simulations results for CO₂ injection into a reservoir caprock system with 9 design variables and 97 samples were used to generate the data for developing the proxy models. The fitted models were validated with using an independent data set and a cross validation approach for three different performance metrics: total storage efficiency, CO₂ plume radius, and average reservoir pressure. The Box Behnken quadratic polynomial metamodel performed the best, followed closely by the maximin LHS kriging metamodel.

Model Selection for CO₂ Sequestration Using Surface Deflection and Injection Data Chiazor Nwachukwu, 2015. In recent years, sequestration of CO₂ in the subsurface has been studied more extensively as an approach to curb carbon emissions into the atmosphere. Monitoring the fate and migration of the CO₂ plume in the aquifer is of utmost interest to regulators and operators. Current monitoring techniques like time lapse seismic are expensive and have limited applicability. Moreover, these techniques have little predictive value unless embedded within a feedback style control scheme. Provided that field data such as bottom hole pressures, well rates, or even surface deformation is available, geologic models for the aquifer can be created and used as an input to a flow simulator to predict the migration of CO₂. A history matching approach has been developed within a model selection framework to select and refine geologic models within a selected set of models until they represent the spatial heterogeneity of the target aquifer and produce forecast with relatively small uncertainty. An initial large suite of models can be created based on prior information of the aquifer. Predicting the response from these models, however, presents a problem in terms of computational time and expense. A particle tracking algorithm has been developed to estimate the flow response from geologic models while significantly reducing computational costs. This algorithm serves as a fast approximation of finite

difference flow simulation models and is meant to provide a rapid estimation of connectivity of the aquifer models A finite element method FEM solver was also developed to approximate the geomechanical effects in the rock caused by the injection of CO₂ The approach used here utilizes a partial coupling scheme to sequentially solve the flow and geomechanical equilibrium equations The validity of the proxies is tested on both 2D and 3D field cases and the solutions are shown to correlate reasonably well with full physics simulations We also demonstrate the application of the model selection algorithm to a 3D reservoir with complex topography The algorithm includes three main steps 1 predicting the flow and geomechanical response of a large prior ensemble of models using the proxies 2 grouping models with similar responses into clusters using multidimensional scaling together with a k means clustering approach and 3 selecting a model cluster that produces the minimum deviation from the observed field data The model selection procedure can be repeated using the sub group of models within a selected cluster in order to further refine the forecasts for future plume migration This entire iterative model selection scheme is demonstrated using the injection data for the Krechba reservoir in Algeria which is an active site for CO₂ sequestration

Forecasting the Path of US CO₂ Emissions Using State-Level Information Max Auffhammer, 2013 In this paper we compare the most common reduced form models used for emissions forecasting point out shortcomings and suggest improvements Using a U S state level panel data set of CO₂ emissions we test the performance of existing models against a large universe of potential reduced form models Our preferred measure of model performance is the squared out of sample prediction error of aggregate CO₂ emissions We find that leading models in the literature as well as models selected based on an emissions per capita loss measure or different in sample selection criteria perform significantly worse compared to the best model chosen based directly on the out of sample loss measure defined over aggregate emissions Unlike the existing literature the tests of model superiority employed here account for model search or data snooping involved in identifying a preferred model Forecasts from our best performing model for the United States are 100 million tons of carbon lower than existing scenarios predict
