 Westheide,2022-01-19 This book is the fourth in a series of 4 volumes in the Handbook of Zoology series about morphology
 anatomy reproduction development ecology phylogeny and systematics of Annelida It covers the most typical polychaetes
 Phyllodocida together with certain smaller taxa placed incertae sedis This volume completes the polychaetous Annelida
 Phyllodocida are often vagile possess well developed parapodia Due to their broad and flat cirri these parapodia look like
 leaves in some taxa and leading to the name of the entire group Many of its members are macrophagous and often predators
 Accordingly most species possess elaborate sense structures such as sensory palps antennae eyes and nuchal organs In
 certain species the eyes comprise thousands of photoreceptor cells and lenses most likely allowing forming true images
 Phyllodocida typically possess an axial muscular pharynx called proboscis functioning as a kind of suction pipe allowing them
 to swallow and ingest their prey or other food This pharynx may be armed with cuticular jaws and some species even possess
 venom glands The probably most popular and important polychaete model organism Platynereis dumerilii belongs to this
 interesting group Phyllodocida fall into two to three higher clades comprising about 25 families which represent more than
 one fourth of the polychaete diversity One of these families Syllidae comprises about 700 valid species of mainly small size
 and may therefore represent one of the most complex and somehow difficult polychaete families on Earth **Minimally**

which the anatomic regions are presented may seem unconventional but it is intended to reflect the importance of transitional regions in understanding anatomic relationships. Wherever possible, regions that border one another are presented in sequence. Additionally, we wanted the format of the second volume to follow that of the first so the joints are placed at the end of the book and the preceding pages are devoted to the upper limb. We start with the neck as it provides a logical transition to the head. The nuchal region serves the same function for the back which, as part of the thoracic cage, forms a gateway to the lateral and anterior chest wall and finally to the upper limbs which originally developed from the torso as ventral buds. A photographic presentation more than any other is bound to reflect individual variations. This is not necessarily a disadvantage and we hope that our approach will serve to flesh out general and abstract principles. Our reference list covers only works that relate directly to the second volume. Other sources may be found by consulting the more comprehensive bibliography and preface of Volume I.
