Explorations in Monte Carlo Methods Ronald W. Shonkwiler, Franklin Mendivil, 2024-06-14 Monte Carlo Methods are among the most used and useful computational tools available today They provide efficient and practical algorithms to solve a wide range of scientific and engineering problems in dozens of areas many of which are covered in this text These include simulation optimization finance statistical mechanics birth and death processes Bayesian inference quadrature gambling systems and more This text is for students of engineering science economics and mathematics who want to learn about Monte Carlo methods but have only a passing acquaintance with probability theory The probability needed to understand the material is developed within the text itself in a direct manner using Monte Carlo experiments for reinforcement There is a prerequisite of at least one year of calculus and a semester of matrix algebra Each new idea is carefully motivated by a realistic problem thus leading to insights into probability theory via examples and numerical simulations Programming exercises are integrated throughout the text as the primary vehicle for learning the material All examples in the text are coded in Python as a representative language the logic is sufficiently clear so as to be easily translated into any other language Further Python scripts for each worked example are freely accessible for each chapter Along the way most of the basic theory of probability is developed in order to illuminate the solutions to the questions posed One of the strongest features of the book is the wealth of completely solved example problems These provide the reader with a sourcebook to follow towards the solution of their own computational problems Each chapter ends with a large collection of homework problems illustrating and directing the material This book is suitable as a textbook for students of engineering

finance and the sciences as well as mathematics The problem oriented approach makes it ideal for an applied course in basic probability as well as for a more specialized course in Monte Carlo Methods Topics include probability distributions probability calculations sampling counting combinatorial objects Markov chains random walks simulated annealing genetic algorithms option pricing gamblers ruin statistical mechanics random number generation Bayesian Inference Gibbs Sampling and Monte Carlo integration

The New Natural History of Madagascar Steven M. Goodman, 2022-11-15 A marvelously illustrated reference to the natural wonders of one of the most spectacular places on earth Separated from Africa's mainland for tens of millions of years Madagascar has evolved a breathtaking wealth of biodiversity becoming home to thousands of species found nowhere else on the planet The New Natural History of Madagascar provides the most comprehensive up to date synthesis available of this island nation's priceless biological treasures Now fully revised and expanded this beautifully illustrated compendium features contributions by more than 600 globally renowned experts who cover the history of scientific exploration in Madagascar as well as the island's geology and soils climate forest ecology human ecology marine and coastal ecosystems plants invertebrates fishes amphibians reptiles birds and mammals This invaluable two volume reference also includes detailed discussions of conservation efforts in Madagascar that showcase several successful protected area programs that can serve as models for threatened ecosystems throughout the world Provides the most comprehensive overview of Madagascar's rich natural history Coedited by 18 different specialists Features hundreds of new contributions by world class experts Includes hundreds of new illustrations Covers a broad array of topics from geology and climate to animals plants and marine life Sheds light on newly discovered species and draws on the latest science An essential resource for anyone interested in Madagascar or tropical ecosystems in general from biologists and conservationists to ecotourists and armchair naturalists

How and Why Species Multiply Peter R. Grant, B. Rosemary Grant, 2020-03-31 Charles Darwin's experiences in the Galapagos Islands in 1835 helped to guide his thoughts toward a revolutionary theory that species were not fixed but diversified from their ancestors over many generations and that the driving mechanism of evolutionary change was natural selection In this concise accessible book Peter and Rosemary Grant explain what we have learned about the origin and evolution of new species through the study of the finches made famous by that great scientist Darwin's finches Drawing upon their unique observations of finch evolution over a thirty four year period the Grants trace the evolutionary history of fourteen different species from a shared ancestor three million years ago They show how repeated cycles of speciation involved adaptive change through natural selection on beak size and shape and divergence in songs They explain other factors that drive finch evolution including geographical isolation which has kept the Galapagos relatively free of competitors and predators climate change and an increase in the number of islands over the last three million years which enhanced opportunities for speciation and flexibility in the early learning of feeding skills which helped species to exploit new food resources Throughout the Grants show how the laboratory tools of developmental biology and molecular genetics can be
