

② Temperature receptors in hypothalamus stimulate heat-producing mechanisms

③

Superficial arteries are constricted, reducing heat loss to the air. Blood flow to the digestive system decreases.

Shivering increases aerobic respiration in the muscles, releasing heat.

Thyroid stimulates cells to increase metabolic heat production.

① Body temperature is low

Temperature homeostasis  
(36.5–37.5°C)

④ Body temperature increases

⑤ Body temperature is high

⑧ Body temperature decreases

⑥ Temperature receptors initiate heat-releasing mechanisms

⑦

Superficial arteries are dilated, causing flushing and increasing heat loss to air. Blood flow is not diverted away from the digestive system.

Sweating initiated in skin.

Houdas, E.F.J. Ring, 2013-06-29 The physiology of man is a complex subject Unfortunately the regulation of temperature in the human body is not always well explained in textbooks Many conference proceedings on the subject have been produced that give excellent detail on research topics However the subject matter is rarely presented as a composite whole New technology has broadened the scope of methods available for studying body temperature Thermography in particular has made it possible to record in real time the temperature distribution of large areas of the body surface Modern image processing methods permit dynamic studies to be carried out and detailed analyses made retrospectively a tremendous advance over the complex and slow techniques formerly used by physiologists Yet although the association between disease and temperature is as old as medicine itself beyond the implicit faith in the clinical mercury thermometer other measuring techniques are finding a slow acceptance This book is designed to put into perspective the critical factors that make up body temperature Body temperature cannot be viewed as a static entity but rather must be seen as a dynamic process An understanding of this phenomenon is important to all who use thermal imaging and measuring techniques in clinical medicine These methods have in recent years brought engineers physicists technicians and clinicians together Inevitably however there are gaps and overlaps in technology and understanding The Public Health Consequences of Disasters Eric K. Noji, 1996-11-14 Natural and man made disasters earthquakes floods volcanic eruptions industrial crises and many others have claimed more than 3 million lives during the past 20 years adversely affected the lives of at least 800 million people and caused more than 50 billion dollars in property damages A major disaster occurs almost daily in some part of the world Increasing population densities in flood plains along vulnerable coastal areas and near dangerous faults in the earth's crust as well as the rapid industrialization of developing economies are factors likely to make the threat posed by natural disasters much bigger in the future Illustrated with examples from recent research in the field this book summarizes the most pertinent and useful information about the public health impact of natural and man made disasters It is divided into four sections dealing with general concerns geophysical events weather related problems and human generated disasters The author starts with a comprehensive discussion of the concepts and role of surveillance and epidemiology highlighting general environmental health concerns such as sanitation water shelter and sewage The other chapters based on a variety of experiences and literature drawn from both developing and industrialized countries cover discrete types of natural and technological hazards addressing their history origin nature observation and control Throughout the book the focus is on the level of epidemiologic knowledge on each aspect of natural and man made disasters Exposure disease and health event surveillance are stressed because of the importance of objective data to disaster epidemiology In addition Noji pays particular attention to prevention and control measures and provides practical recommendations in areas in which the public health practitioner needs more

useful information He advocates stronger epidemiologic awareness as the basis for better understanding and control of disasters A comprehensive theoretical and practical treatment of the subject The Public Health Consequences of Disasters is an invaluable tool for epidemiologists disaster relief specialists and physicians who treat disaster victims Galapagos Giant Tortoises, 2020-11-07 Galapagos Giant Tortoises brings together researchers and conservationists to share the most up to date knowledge of Galapagos giant tortoises Despite being icons of the world famous Galapagos Archipelago and the target of more than 50 years of conservation research and management Galapagos giant tortoise evolution and much of their ecology remained unknown until recently This book documents the history the pressing conservation issues and success stories recovering several of the 15 different species of Galapagos tortoises from near extinction The book begins with an overview of the history of the relationship between humans and Galapagos giant tortoises starting from initial heavy exploitation of tortoises by pirates and whalers and extending to the start of the modern conservation era in the 1960s The book then shifts to biology describing Galapagos tortoise evolution taxonomy ecology habitats reproduction and behavior Next the decades of conservation efforts and their results are reviewed including issues of captive breeding invasive species introduced diseases and de extinction as well as the current status and distribution of every species The final portion of the book turns to four case studies of restoration and then looks ahead to the future of all tortoise populations The latest volume in the Biodiversity of the World Conservation from Genes to Landscape series Galapagos Giant Tortoises is a valuable resource for researchers and conservationists as well as students of biology wildlife conservation and herpetology Provides a comprehensive overview of the Galapagos giant tortoise species as written and edited by the world s leading experts Presents examples of restoration of tortoise populations following the near extinction of many of them Describes conservation strategies to ensure the full recovery of all extant species Explores recent efforts using replacement tortoises for extinct species to restore island ecosystems Stevens' Handbook of Experimental Psychology, Sensation and Perception Steven Yantis, 2004-02-05 Now available in paperback This revised and updated edition of the definitive resource for experimental psychology offers comprehensive coverage of the latest findings in the field as well as the most recent contributions in methodology and the explosion of research in neuroscience Volume One Sensation and Perception focuses on sensory experience and complex learned perceptions through modalities such as vision touch smell and hearing Textbook Of Forensic Medicine And Toxicology: Principles And Practice Vij, 2008 The book is a comprehensive and authoritative exposition of Forensic Medicine and Toxicology It provides precise and useful information on relevant legal provisions and forensic anatomy and promotes interdisciplinary understanding of issues where law and medicine converge The text is oriented towards the practical problems encountered during day to day medicolegal work About the Author Krishnan Vij MD L L B is Professor and Head Department of Forensic Medicine and Toxicology Government Medical College Hospital Chandigarh India *New Frontiers in Respiratory Control* Ikuo Homma, Hiroshi Onimaru, Yoshinosuke Fukuchi, 2010-03-10

Breathing is performed by the rhythmic contraction of respiratory muscles. It maintains homeostasis of the organism by taking in the oxygen necessary to live and work and by controlling the level of CO<sub>2</sub> within the organism. At first glance breathing seems simple, however, it is produced by a complex system in the brain with various afferents and efferents. The control of breathing is of the utmost importance in sustaining life, and although more than 150 years have passed since research on breathing control was first begun, many unsolved mysteries still remain. Breathing is like watching the tides at a beach that are created by the vast complex open sea. The first Oxford Conference on Modeling and Control of Breathing was held 30 years ago in September of 1978 at the University Laboratory of Physiology in Oxford, England. During this first conference, the participants engaged in a hot discussion on the problem of whether breathing rhythm was produced by pacemaker cells or a neural network. This was before the discovery of the Böttinger complex in the medulla, and at the time, central chemoreceptive areas were still the focus of research. This conference was an especially unforgettable moment in the dawning of the new age of respiratory research. It has since been held every 3 years in various countries around the globe and is widely appreciated as the best respiratory meeting in the world.
